We thank Hope Steele for her superb editing work and Ha Nguyen for her excellent graphic design and layout.

The terms *country* and *nation* as used in this report do not in all cases refer to a territorial entity that is a state as understood by international law and practice. The terms cover well-defined, geographically self-contained economic areas that may not be states but for which statistical data are maintained on a separate and independent basis.

Partner Institutes

The World Economic Forum's Global Competitiveness Network is pleased to acknowledge and thank the following organizations as our valued Partner Institutes, without whom the realization of *The Global Competitiveness Report 2008–2009* would not have been feasible:

Albania

Institute for Contemporary Studies (ISB)
Artan Hoxha, President
Elira Jorgoni, Senior Expert and Project Manager
Denalada Kuzumi, Researcher

Algeria

Centre de Recherche en Economie Appliquée pour le Développement (CREAD)
Youcef Benabdallah, Assistant Professor
Yassine Ferfera, Director

Argentina

IAE—Universidad Austral
María Elina Gigaglia, Project Manager
Eduardo Luis Fracchia, Professor

Armenia

Economy and Values Research Center
Manuk Hergnyan, Chairman
Sevak Hovhannisyán, Board Member and Senior Associate
Gohar Malumyan, Research Associate

Australia

Australian Industry Group
Nicholas James, Economist
Tony Pensabene, Associate Director, Economics & Research
Heather Ridout, Chief Executive

Austria

Austrian Institute of Economic Research (WIFO)
Karl Aiginger, Director
Gerhard Schwarz, Coordinator, Survey Department

Azerbaijan

Azerbaijan Marketing Society
Fuad Aliyev, Executive Director
Ashraf Hajiyev, Project Coordinator
Saïda Talibova, Consultant

Bahrain

Bahrain Competitiveness Council, Bahrain Economic Development Board
Nada Azmi, Business Intelligence Specialist, Research Services Unit
Jawad Habib, Senior Partner, BDO Jawad Habib
Rima Al Kilani, Director, International Marketing

Bangladesh

Centre for Policy Dialogue (CPD)
Khondaker Golam Moazzem, Senior Research Fellow
Kazi Mahmudur Rahman, Senior Research Associate
Mustafizur Rahman, Executive Director

Barbados

Arthur Lewis Institute for Social and Economic Studies, University of West Indies (UWI)
Andrew Downes, Director

Belgium

Vlerick Leuven Gent Management School
Lutgart Van den Berghe, Professor, Executive Director and Chairman, Competence Centre Entrepreneurship, Governance and Strategy
Bieke Dewulf, Associate, Competence Centre Entrepreneurship, Governance and Strategy
Wim Moesen, Professor

Benin

Micro Impacts of Macroeconomic Adjustment Policies (MIMAP) Benin
Epiphane Adjovi, Business Coordinator
Maria-Odile Attanasso, Deputy Coordinator
Fructueux Deguenonvo, Researcher

Bosnia and Herzegovina

MIT Center, School of Economics and Business in Sarajevo, University of Sarajevo
Zlatko Lagumdžija, Professor
Željko Šain, Executive Director
Jasmina Selimovic, Assistant Director

Botswana

Botswana National Productivity Centre
Dabilani Buthali, Manager, Information and Research Services Department
Thembo Lebang, Executive Director
Omphemetse David Matlhape, Research Consultant

Brazil

Fundação Dom Cabral
Marina Araújo, Researcher
Carlos Arruda, Professor and Coordinator of Competitiveness and Innovation Center
Juan Rios, Research Assistant
Movimento Brasil Competitivo (MBC)
Cláudio Leite Gastal, Director President
Lucas Tadeu Melo Câmara, Director

Brunei Darussalam

Ministry of Industry and Primary Resources
Pehin Dato Dr. Hj Ahmad Hj Jumat, Minister
Dato Paduka Hj Hamdillah Hj Abd Wahab, Deputy Minister
Dato Paduka Hamid Hj Mohd Jaafar, Permanent Secretary

Bulgaria

Center for Economic Development
Anelia Damianova, Senior Expert

Burkina Faso

Société d'Etudes et de Recherche Formation pour le Développement (SERF)
Abdoulaye Tarnagda, Director General

Burundi

University Research Centre for Economic and Social Development (CURDES), National University of Burundi
Richard Ndereyahaga, Head of CURDES
Gilbert Niyongabo, Dean, Faculty of Economics & Management

Cambodia

Economic Institute of Cambodia
Sok Hach, Director
Tuy Chak Riya, Research Associate
Hang Sambopisith, Researcher

Cameroon

Comité de Compétitivité (Competitiveness Committee)
Lucien Sanzouango, Permanent Secretary

Canada

Institute for Competitiveness and Prosperity
Lance Bialas, Researcher
Roger Martin, Chairman and Dean of the Rotman School
of Management, University of Toronto
James Milway, Executive Director

Chad

Groupe de Recherches Alternatives et de Monitoring du
Projet Pétrole-Tchad-Cameroun (GRAMP-TC)
Antoine Doudjidingao, Researcher
Gilbert Maoundonodji, Director
Celine Nénodji Mbaïpeur, Program Officer

Chile

Universidad Adolfo Ibáñez
Ignacio Briones, Associate Professor of Economics,
School of Government
Leonidas Montes, Dean, School of Government

China

Institute of Economic System and Management
National Development and Reform Commission
Zhou Haichun, Deputy Director and Professor
Chen Wei, Research Fellow
Dong Ying, Professor
China Center for Economic Statistics Research, Tianjin University
of Finance and Economics
Lu Dong, Professor
Jian Wang, Associate Professor
Huazhang Zheng, Associate Professor

Colombia

National Planning Department
Orlando Gracia Fajardo, Entrepreneurial Development Director
Carolina Rentería Rodríguez, General Director
Mauricio Torres Velásquez, Advisor

Côte d'Ivoire

Chambre de Commerce et d'Industrie de Côte d'Ivoire
Mamadou Sarr, General Director

Croatia

National Competitiveness Council
Martina Hatlak, Research Assistant
Mira Lenardic, General Secretary

Cyprus

Cyprus College Research Center
Bambos Papageorgiou, Head of Socioeconomic and
Academic Research
The Cyprus Development Bank
Maria Markidou-Georgiadou, Manager, International
Banking Services Unit and Business Development

Czech Republic

CMC Graduate School of Business
Dagmar Glückaufová, Academic Dean
Filip Hrnáfi, President

Denmark

Copenhagen Business School, Department of International
Economics and Management
Lise Peitersen, Administrative Director
Ole Risager, Professor

Ecuador

Escuela de Postgrado en Administración de Empresas (ESPAE)
Escuela Superior Politécnica del Litoral (ESPOL)
Elizabeth Arteaga, Project Assistant
Virginia Lasio, Acting Director
Sara Wong, Professor

Egypt

The Egyptian Center for Economic Studies
Hanaa Kheir-El-Din, Executive Director and Director of Research

Estonia

Estonian Institute of Economic Research
Evelin Ahermaa, Head of Economic Research Sector
Marje Josing, Director
Estonian Development Fund
Kitty Kubo, Head of Foresight
Ott Pärna, Chief Executive Officer

Ethiopia

African Institute of Management, Development and Governance
Tegegne Teka, General Manager

Finland

ETLA—The Research Institute of the Finnish Economy
Petri Rouvinen, Research Director
Pasi Sorjonen, Head of the Forecasting Group
Pekka Ylä-Anttila, Managing Director

France

HEC School of Management, Paris
Bertrand Moingeon, Professor, Deputy Dean
Bernard Ramanantsoa, Professor, Dean of HEC School of
Management

Gambia, The

Gambia Economic and Social Development Research Institute
(GESDRI)
Makaireh A. Njie, Director

Georgia

Business Initiative for Reforms in Georgia
Giga Makharadze, Founding Member of the Board of Directors
Tamar Tchintcharauli, Executive Director
Mamuka Tsereteli, Founding Member of the Board of Directors

Germany

WHU—Otto Beisheim School of Management, Vallendar
Ralf Fendel, Professor of Monetary Economics
Michael Frenkel, Professor, Chair of Macroeconomics and
International Economics

Ghana

Association of Ghana Industries (AGI)
Carlo Hey, Project Manager
Cletus Kosiba, Executive Director
Tony Oteng-Gyasi, President

Greece

SEV Hellenic Federation of Enterprises
Michael Mitsopoulos, Coordinator, Research and Analysis
Thanasis Printsipas, Economist, Research and Analysis

Guatemala

FUNDESA
Edgar A. Heinemann, President of the Board of Directors
Pablo Schneider, Economic Director
Juan Carlos Zapata, General Manager

Guyana

Institute of Development Studies, University of Guyana
Karen Pratt, Research Associate
Clive Thomas, Director

Hong Kong SAR

Hong Kong General Chamber of Commerce
David O'Rear, Chief Economist

Federation of Hong Kong Industries
Alexandra Poon, Director

Hungary

KOPINT-TÁRKI Economic Research Ltd.
Ágnes Nagy, Project Manager
Éva Palócz, Chief Executive Officer

Iceland

Innovation Center Iceland
Karl Fridriksson, Managing Director of Human Resources and Services
Rosa Signy Gísladóttir, Manager, Marketing and Media Relations
Thorsteinn I. Sigfusson, Director

India

Confederation of Indian Industry
Chandrajit Banerjee, Director-General
Tarun Das, Chief Mentor
T S Vishwanath, Senior Director and Head, International Trade Policy

Indonesia

Kadin Indonesia
M.S. Hidayat, Chairman
Tulus Tambunan, Director

Ireland

Competitiveness Survey Group, Department of Economics, University College Cork
Eleanor Doyle, Professor, Department of Economics
Niall O'Sullivan
Bernadette Power
National Competitiveness Council
Adrian Devitt, Manager
Caoimhe Gavin, Policy Advisor
Gráinne Greehy, Graduate Trainee

Israel

Manufacturers' Association of Israel (MAI)
Shraga Brosh, President
Dan Catarivas, Director
Yehuda Segev, Managing Director

Italy

Preface

KLAUS SCHWAB

Executive Chairman, World Economic Forum

This year's *Global Competitiveness Report* is being released at a time of multiple shocks to the global economy. The subprime mortgage crisis and the ensuing credit crunch, combined with rising inflation worldwide and the consequent slowdown in demand in many advanced economies, has engendered significant uncertainty about the short-term outlook for the world economy. Global growth is slowing, and it is not yet clear when the effects of the present crisis will subside.

The financial market crisis that began in early 2007 is almost unprecedented in its impact, having resulted not only in losses in markets and for financial institutions, but also in an erosion of public confidence in the financial sector and among the institutions themselves across the industrialized world. In the meantime, rising energy and commodity prices are having a dual effect on emerging and developing economies: on the one hand, boosting growth; on the other hand creating inflationary pressures that raise the basic cost of living, thus increasing poverty levels. More generally, although the present slowdown was originally expected to be confined mainly to the United States, it is now spreading to other industrialized economies and it is not yet clear what the future will bring for emerging markets.

Policymakers are presently struggling with ways of managing these multiple shocks intelligently while preparing their economies to perform well in an economic landscape characterized by growing volatility. In an unstable global financial environment, it is more important than ever for countries to put into place the fundamentals underpinning economic growth and development. The World Economic Forum has for the past 30 years played a facilitating role in this process, by providing detailed assessments of the productive potential of nations worldwide. The *Report* is a contribution to enhancing our understanding of the key factors determining economic growth, and explaining why some countries are much more successful than others in raising income levels and opportunities for their respective populations, offering policymakers and business leaders an important tool in the formulation of improved economic policies and institutional reforms.

This year's *Report* is characterized by the continued expansion of our country coverage. Currently featuring a total of 134 economies, it remains the most comprehensive assessment of its kind. The *Report* contains a detailed profile for each of the economies featured in

the study as well as an extensive section of data tables with global rankings covering over 100 indicators.

This *Report* remains our flagship publication within our Global Competitiveness Network, which groups a number of research studies that truly mirror the increased integration and complexity of the world economy. Concurrent complementary publications include *The Global Information Technology Report 2007–2008*, *The Travel & Tourism Competitiveness Report 2008*, *The Global Enabling Trade Report 2008*, *The Financial Development Report 2008*, and *The Global Gender Gap Report 2007*.

The Global Competitiveness Report could not have been put together without the thought leadership of our distinguished editor, Professor Michael E. Porter, Director of the Institute for Strategy and Competitiveness at the Harvard Business School, and his team Christian Ketels, Richard Bryden, and Mercedes Delgado. Appreciation also goes to Professor Xavier Sala-i-Martin, at Columbia University, for his ongoing intellectual support of our competitiveness research. Appreciation also goes to Fiona Paua, Head of Strategic Insight Teams at the Forum, and Jennifer Blanke, Head of the Global Competitiveness Network, as well as team members Ciara Browne, Agustina Ciocia, Margareta Drzeniek Hanouz, Thierry Geiger, Patrick McGee, Irene Mia, Pearl Samandari, and Eva Trujillo Herrera. We thank FedEx and USAID, our partners in this *Report*, for their support in this important venture. Finally, we would also like to convey our sincere gratitude to all the business executives around the world, who took the time to participate in our Executive Opinion Survey, and whose valuable inputs made the publication of this *Report* possible.

World Economic Forum

After several years of rapid and almost unhampered growth, the global economic landscape is changing. Rising food and energy prices, a major international financial crisis, and the related slowdown in the world's leading economies are confronting policymakers with new economic management challenges. Today's volatility underscores the importance of a competitiveness-supporting economic environment that can help national economies to weather these types of shocks in order to ensure solid economic performance going into the future.

A nation's level of competitiveness reflects the extent to which it is able to provide rising prosperity to its citizens. Since 1979, the World Economic Forum's annual *Global Competitiveness Reports* have examined the many factors enabling national economies to achieve sustained economic growth and long-term prosperity. Our goal over the years has been to provide benchmarking tools for business leaders and policymakers to identify obstacles to improved competitiveness, stimulating discussion on strategies to overcome them. For the past several years, the World Economic Forum has based its competitiveness analysis on the Global Competitiveness Index (GCI), a highly comprehensive index for measuring national competitiveness, which captures the microeconomic and macroeconomic foundations of national competitiveness.

We define *competitiveness* as *the set of institutions, policies, and factors that determine the level of productivity of a country*. The level of productivity, in turn, sets the sustainable level of prosperity that can be earned by an economy. In other words, more competitive economies tend to be able to produce higher levels of income for their citizens. The productivity level also determines the rates of return obtained by investments in an economy. Because the rates of return are the fundamental drivers of the growth rates of the economy, a more competitive economy is one that is likely to grow faster over the medium to long run.

The concept of competitiveness thus involves static and dynamic components: although the productivity of a country clearly determines its ability to sustain a high *level* of income, it is also one of the central determinants of the returns to investment, which is one of the key factors explaining an economy's *growth potential*.

The 12 pillars of competitiveness

The determinants of competitiveness are many and complex. For hundreds of years, economists have tried to understand what determines the wealth of nations. This attempt has ranged from Adam Smith's focus on specialization and the division of labor to neoclassical economists' emphasis on investment in physical capital and infrastructure, and, more recently, to interest in other mechanisms such as education and training, technological progress (whether created within the country or adopted from abroad),¹ macroeconomic stability, good governance, the rule of law, transparent and well-functioning

institutions, firm sophistication, demand conditions, market size, and many others. Each of these conjectures rests on solid theoretical foundations and makes common sense. The central point, however, is that they are not mutually exclusive—so that two or more of them could be true at the same time. Hundreds of econometric studies show that many of these conjectures are, in fact, simultaneously true.² This also can partly explain why, despite the present global financial crisis, we do not necessarily see large swings in competitiveness ratings, for example in the United States. Financial markets are only one of several important components of national competitiveness.

The GCI captures this open-ended dimension by providing a weighted average of many different components, each of which reflects one aspect of the complex reality that we call competitiveness. We group all these components into *12 pillars of economic competitiveness*:

First pillar: Institutions

The institutional environment forms the framework within which individuals, firms, and governments interact to generate income and wealth in the economy. The institutional framework has a strong bearing on competitiveness and growth.³ It plays a central role in the ways in which societies distribute the benefits and bear the costs of development strategies and policies, and it influences investment decisions and the organization of production. Owners of land, corporate shares, and even intellectual property are unwilling to invest in the improvement and upkeep of their property if their rights as owners are insecure.⁴ Of equal importance, if property cannot be bought and sold with the confidence that the authorities will endorse the transaction, the market itself will fail to generate dynamic growth.

The importance of institutions is not restricted to the legal framework. Government attitudes toward markets and freedoms and the efficiency of its operations are also very important: excessive bureaucracy and red tape,⁵ overregulation, corruption, dishonesty in dealing with public contracts, lack of transparency and trustworthiness, or the political dependence of the judicial system impose significant economic costs to businesses and slow down the process of economic development.

Although the economic literature has mainly focused on public institutions, private institutions are also an important element in the process of creation of wealth. The significant corporate scandals that have occurred over the past few years, and the present global financial crisis, have highlighted the relevance of accounting and reporting standards and transparency for preventing fraud and mismanagement, ensuring good governance, and maintaining investor and consumer confidence. An economy is well served by businesses that are run honestly, where managers abide by strong ethical practices in their dealings with the government,

other firms, and the public.⁶ Private-sector transparency is indispensable to business, and can be brought about through the use of standards as well as auditing and accounting practices that ensure access to information in a timely manner.⁷

Second pillar: Infrastructure

Extensive and efficient infrastructure is an essential driver of competitiveness. It is critical for ensuring the effective functioning of the economy, as it is an important factor determining the location of economic activity and the kinds of activities or sectors that can develop in a particular economy. Well-developed infrastructure reduces the effect of distance between regions, with the result of truly integrating the national market and connecting it to markets in other countries and regions. In addition, the quality and extensiveness of infrastructure networks significantly impact economic growth and reduce income inequalities and poverty in a variety of ways.⁸ In this regard, a well-developed transport and communications infrastructure network is a prerequisite for the ability of less-developed communities to connect to core economic activities and schools.

Effective modes of transport for goods, people, and services—such as quality roads, railroads, ports, and air transport—enable entrepreneurs to get their goods to market in a secure and timely manner, and facilitate the movement of workers to the most suitable jobs. Economies also depend on electricity supplies that are free of interruptions and shortages so that businesses and factories can work unimpeded. Finally, a solid and extensive telecommunications network allows for a rapid and free flow of information, which increases overall economic efficiency by helping to ensure that decisions made by economic actors take into account all available relevant information.

Third pillar: Macroeconomic stability

The stability of the macroeconomic environment is important for business and, therefore, is important for the overall competitiveness of a country.⁹ Although it is certainly true that macroeconomic stability alone cannot increase the productivity of a nation, it is also recognized that macroeconomic disarray harms the economy. Firms cannot make informed decisions when inflation is raging out of control. The government cannot provide services efficiently if it has to make high-interest payments on its past debts. In sum, the economy cannot grow unless the macro environment is stable.

Fourth pillar: Health and primary education

A healthy workforce is vital to a country's competitiveness and productivity. Workers who are ill cannot function to their potential, and will be less productive. Poor health leads to significant costs to business, as sick workers are often absent or operate at lower levels of efficiency.

Investment in the provision of health services is thus critical for clear economic, as well as moral, considerations.¹⁰

In addition to health, this pillar takes into account the quantity and quality of basic education received by the population, which is increasingly important in today's economy. Basic education increases the efficiency of each individual worker. Moreover, a workforce that has received little formal education can carry out only basic manual work and finds it much more difficult to adapt to more advanced production processes and techniques. Lack of basic education can therefore become a constraint on business development, with firms finding it difficult to move up the value chain by producing more sophisticated or value-intensive products.

Fifth pillar: Higher education and training

Quality higher education and training is crucial for economies that want to move up the value chain beyond simple production processes and products.¹¹ In particular, today's globalizing economy requires economies to nurture pools of well-educated workers who are able to adapt rapidly to their changing environment. This pillar measures secondary and tertiary enrollment rates as well as the quality of education as assessed by the business community. The extent of staff training is also taken into consideration because of the importance of vocational and continuous on-the-job training—which is neglected in many economies—for ensuring a constant upgrading of workers' skills to the changing needs of the evolving economy.

Sixth pillar: Goods market efficiency

Countries with efficient goods markets are well positioned to produce the right mix of products and services given supply-and-demand conditions, as well as to ensure that these goods can be most effectively traded in the economy. Healthy market competition, both domestic and foreign, is important in driving market efficiency and thus business productivity, by ensuring that the most efficient firms, producing goods demanded by the market, are those that thrive. The best possible environment for the exchange of goods requires a minimum of impediments to business activity through government intervention to be in place. For example, competitiveness is hindered by distortionary or burdensome taxes, and by restrictive and discriminatory rules on foreign ownership or foreign direct investment (FDI). Market efficiency also depends on demand conditions such as customer orientation and buyer sophistication. For cultural reasons, customers in some countries may be more demanding than in others. This can create an important competitive advantage, as it forces companies to be more innovative and customer-oriented and thus imposes the discipline necessary for efficiency to be achieved in the market.

Seventh pillar: Labor market efficiency

The efficiency and flexibility of the labor market are critical for ensuring that workers are allocated to their most efficient use in the economy, and provided with incentives to give their best effort in their jobs. Labor markets must therefore have the flexibility to shift workers from one economic activity to another rapidly and at low cost, and to allow for wage fluctuations without much social disruption. Efficient labor markets must also ensure a clear relationship between worker incentives and their efforts, as well as the best use of available talent—which includes equity in the business environment between women and men.

Eighth pillar: Financial market sophistication

The present global financial crisis has highlighted the critical importance of financial markets for the functioning of national economies. An efficient financial sector is necessary to allocate the resources saved by a nation's citizens as well as those entering the economy from abroad to their most productive uses. It channels resources to the entrepreneurial or investment projects with the highest expected rates of return, rather than to the politically connected. A thorough assessment of risk is therefore a key ingredient.

Business investment is critical to productivity. Therefore economies require sophisticated financial markets that can make capital available for private-sector investment from such sources as loans from a sound banking sector, well-regulated securities exchanges, venture capital, and other financial products. An efficient financial sector also ensures that innovators with good ideas have the financial resources to turn those ideas into commercially viable products and services. In order to fulfill all those functions, the banking sector needs to be trustworthy and transparent.¹²

Ninth pillar: Technological readiness

This pillar measures the agility with which an economy adopts existing technologies to enhance the productivity of its industries.¹³ In today's globalized world, technology has increasingly become an important element for firms to compete and prosper. In particular, information and communication technologies (ICT) have evolved into the "general purpose technology" of our time,¹⁴ given the critical spillovers to the other economic sectors and their role as efficient infrastructure for commercial transactions. Therefore ICT access (including the presence of an ICT-friendly regulatory framework) and usage are included in the pillar as essential components of economies' overall level of technological readiness.

Whether the technology used has or has not been developed within national borders is irrelevant for its effect on competitiveness. The central point is that the firms operating in the country have access to advanced products and blueprints and the ability to use them. That is, it does not matter whether the personal

computer or the Internet was invented in a particular country. What is important is that these inventions are available to the business community. This does not mean that the process of innovation is irrelevant. However, the level of technology available to firms in a country needs to be distinguished from the country's ability to innovate and expand the frontiers of knowledge. That is why we separate technological readiness from innovation, which is captured in the 12th pillar below.

Tenth pillar: Market size

The size of the market affects productivity because large markets allow firms to exploit economies of scale.

Traditionally, the markets available to firms have been constrained by national borders. In the era of globalization, international markets have become a substitute for domestic markets, especially for small countries. There is vast empirical evidence that shows that trade openness is positively associated with growth. Even if some recent research casts doubts on the robustness of this relationship, the general sense is that trade has a positive effect on growth, especially for countries with small domestic markets.¹⁵

Thus, exports can be thought of as a substitute for domestic demand in determining the size of the market for the firms of a country.¹⁶ By including both domestic and foreign markets in our measure of market size, we give credit to export-driven economies and geographic areas (such as the European Union) that are broken into many countries but have one common market.

Eleventh pillar: Business sophistication

Business sophistication is conducive to higher efficiency in the production of goods and services. This leads, in turn, to increased productivity, thus enhancing a nation's competitiveness. Business sophistication concerns the quality of a country's overall business networks as well as the quality of individual firms' operations and strategies. It is particularly important for countries at an advanced stage of development, when the more basic sources of productivity improvements have been exhausted to a large extent.

The quality of a country's business networks and supporting industries, which we capture by using variables on the quantity and quality of local suppliers and the extent of their interaction, is important for a variety of reasons. When companies and suppliers from a particular sector are interconnected in geographically proximate groups ("clusters"), efficiency is heightened, greater opportunities for innovation are created, and barriers to entry for new firms are reduced. Individual firms' operations and strategies (branding, marketing, the presence of a value chain, and the production of unique and sophisticated products) all lead to sophisticated and modern business processes.

Twelfth pillar: Innovation

The last pillar of competitiveness is technological innovation. Although substantial gains can be obtained by improving institutions, building infrastructures, reducing macroeconomic instability, or improving the human capital of the population, all these factors eventually seem to run into diminishing returns. The same is true for the efficiency of the labor, financial, and goods markets. In the long run, standards of living can be expanded only with technological innovation. Innovation is particularly important for economies as they approach the frontiers of knowledge and the possibility of integrating and adapting exogenous technologies tends to disappear.¹⁷

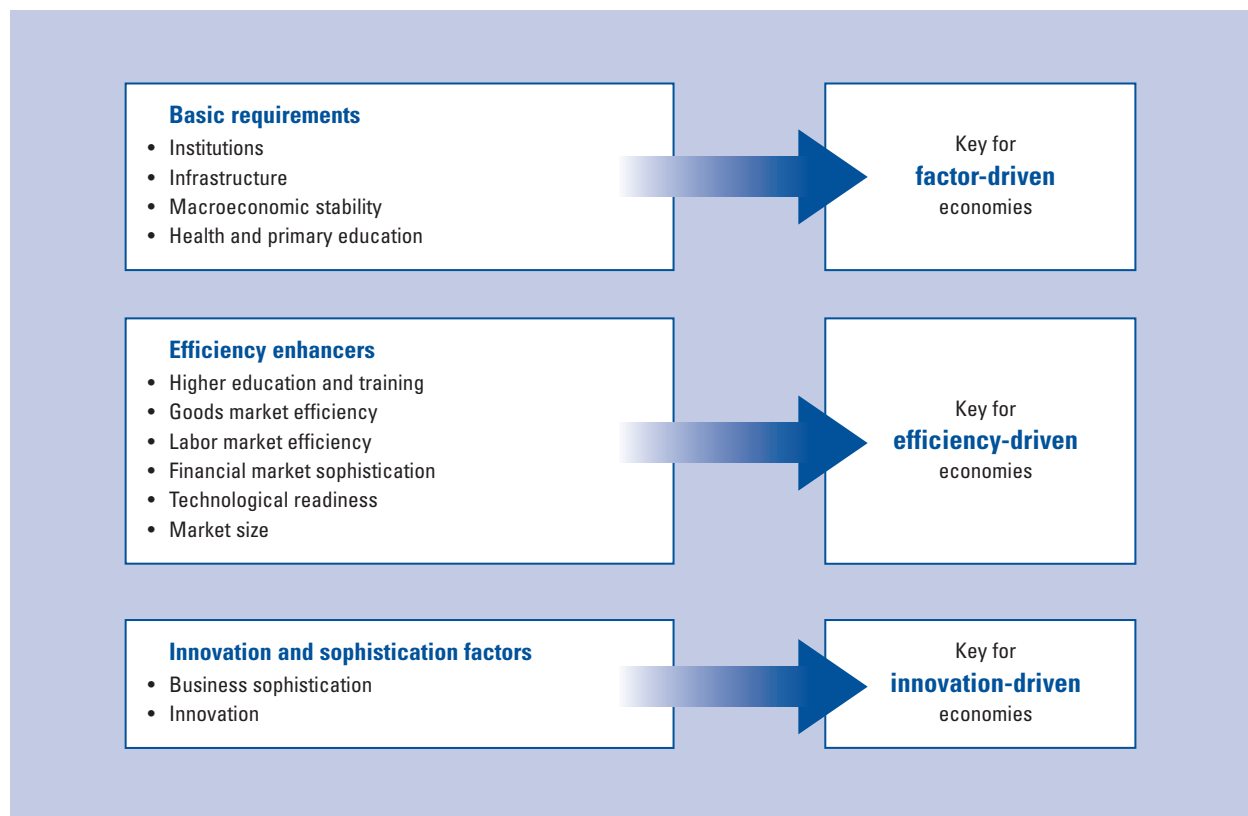

Although less-advanced countries can still improve their productivity by adopting existing technologies or making incremental improvements in other areas, for countries that have reached the innovation stage of development, this is no longer sufficient to increase productivity. Firms in these countries must design and develop cutting-edge products and processes to maintain a competitive edge. This requires an environment that is conducive to innovative activity, supported by both the public and the private sectors. In particular, this means sufficient investment in research and development (R&D) especially by the private sector, the presence of high-quality scientific research institutions, extensive collaboration in research between universities and industry, and the protection of intellectual property.

The interrelation of the 12 pillars

Although the 12 pillars of competitiveness are described separately, this should not obscure the fact that they are not independent: not only they are related to each other, but they tend to reinforce each other. For example, innovation (12th pillar) is not possible in a world without institutions (1st pillar) that guarantee intellectual property rights, cannot be performed in countries with poorly educated and poorly trained labor force (5th pillar), and will never take place in economies with inefficient markets (6th, 7th, and 8th pillars) or without extensive and efficient infrastructure (2nd pillar).

Although the actual construction of the Index will involve the aggregation of the 12 pillars into a single index, measures are reported for the 12 pillars separately because offering a more disaggregated analysis can be more useful to countries and practitioners: such an analysis gets closer to the actual areas in which a particular country needs to improve.

Figure 1: The 12 pillars of competitiveness

Stages of development and the weighted Index

It is clear that different pillars affect different countries differently: the best way for Chad to improve its competitiveness is not the same as the best way for the United States. This is because Chad and the United States are in different stages of development: as countries move along the development path, wages tend to increase and, in order to sustain this higher income, labor productivity must improve.¹⁸

According to the GCI, in the first stage, the economy is *factor-driven* and countries compete based on their factor endowments, primarily unskilled labor and natural resources. Companies compete on the basis of price and sell basic products or commodities, with their low productivity reflected in low wages. Maintaining competitiveness at this stage of development hinges primarily on well-functioning public and private institutions (pillar 1), well-developed infrastructure (pillar 2), a stable macroeconomic framework (pillar 3), and a healthy and literate workforce (pillar 4).

As wages rise with advancing development, countries move into the *efficiency-driven* stage of development, when they must begin to develop more efficient production processes and increase product quality. At this point, competitiveness is increasingly driven by higher education and training (pillar 5), efficient goods markets (pillar 6), well-functioning labor markets (pillar 7),

sophisticated financial markets (pillar 8), a large domestic or foreign market (pillar 10), and the ability to harness the benefits of existing technologies (pillar 9).

Finally, as countries move into the *innovation-driven* stage, they are able to sustain higher wages and the associated standard of living only if their businesses are able to compete with new and unique products. At this stage, companies must compete through innovation (pillar 12), producing new and different goods using the most sophisticated production processes (pillar 11).

The concept of stages of development is integrated into the Index by attributing higher relative weights to those pillars that are relatively more relevant for a country given its particular stage of development. That is, although all 12 pillars matter to a certain extent for all countries, the importance of each one depends on a country's particular stage of development. To take this into account, the pillars are organized into three subindexes, each critical to a particular stage of development. The *basic requirements subindex* groups those pillars most critical for countries in the factor-driven stage. The *efficiency enhancers subindex* includes those pillars critical for countries in the efficiency-driven stage. And the *innovation and sophistication factors subindex* includes the pillars critical to countries in the innovation-driven stage. The three subindexes are shown in Figure 1.

The specific weights we attribute to each subindex in every stage of development are shown in Table 1. To obtain the precise weights, a maximum likelihood regression of GDP per capita was run against each subindex for past years, allowing for different coefficients for each stage of development.¹⁹ The rounding of these econometric estimates led to the choice of weights displayed in Table 1.

Table 1: Weights of the three main groups of pillars at each stage of development

Pillar group	Factor-driven stage (%)	Efficiency-driven stage (%)	Innovation-driven stage (%)
Basic requirements	60	40	20
Efficiency enhancers	35	50	50
Innovation and sophistication factors	5	10	30

Implementation of stages of development: Smooth transitions

Countries are allocated to stages of development based on two criteria. The first criterion is the level of GDP per capita at market exchange rates. This widely available measure is used as a proxy for wages, as internationally comparable data for the latter are not available for all countries covered. The precise thresholds are shown in Table 2. A second criterion measures the extent to which countries are factor driven. We proxy this by the share of exports of primary goods in total exports (goods and services) and assume that countries that export more than 70 percent of primary products are to a large extent factor driven.²⁰

Table 2: Income thresholds for establishing stages of development

Stage of Development	GDP per capita (in US\$)
Stage 1: Factor driven	< 2,000
<i>Transition from stage 1 to stage 2</i>	<i>2,000–3,000</i>
Stage 2: Efficiency driven	3,000–9,000
<i>Transition from stage 2 to stage 3</i>	<i>9,000–17,000</i>
Stage 3: Innovation driven	> 17,000

Countries falling in between two of the three stages are considered to be “in transition.” For these countries, the weights change smoothly as a country develops, reflecting the smooth transition from one stage of development to another. By introducing this type of transition between stages into the model—that is, by placing increasingly more weight on those areas that are becoming more important for the country’s competitiveness as the country develops—the index can gradually “penalize”

those countries that are not preparing for the next stage. The classification of countries into stages of development is shown in Table 3.

Country coverage

Four new economies have been included in the analysis: Brunei Darussalam, Côte d’Ivoire, Ghana, and Malawi (reintroduced after a one-year absence). On the other hand, one country covered last year, Uzbekistan, is not covered this year because of a lack of Survey data. This has led to a net increase in country coverage, for a total of 134 economies this year.

Appendix A describes the exact composition of the GCI and technical details of its construction.

The Global Competitiveness Index 2008–2009 rankings

The detailed rankings from this year’s GCI are shown in Tables 4 through 8. As Table 4 shows, almost all of the countries in the top 10 remain the same as last year, with some small shifts in rank. The following sections reference the findings of the GCI 2008–2009 for the top performers globally, as well as for a number of selected economies in each of the five following regions: Europe, Latin America and the Caribbean, Asia and the Pacific, Middle East and North Africa, and sub-Saharan Africa.

Top 10

Notwithstanding the present financial crisis, the **United States** continues to be the most competitive economy in the world, a position it has held for several years. This is because the country is endowed with many structural features that make its economy extremely productive and that place it on a strong footing to ride out business cycle shifts and economic shocks. Thus, despite rising concerns about the soundness of the banking sector and macroeconomic weaknesses, the country’s many other strengths continue to make it a very productive environment. The United States is followed by Switzerland, Denmark, and Sweden, composing the same top four countries as last year.

The United States is home to highly sophisticated and innovative companies operating in very efficient factor markets. The country is also endowed with an excellent university system that collaborates strongly with the business sector in R&D. Combined with the scale opportunities afforded by the sheer size of its domestic economy, the largest in the world by far, these qualities make the United States the most competitive economy in the world.

The United States is ranked 1st on the innovation pillar, with the world’s top-rated scientific research institutions, high company spending on R&D (ranked 3rd), and significant collaboration between the business and university sectors in research (ranked 1st). The country’s markets support this innovative activity through their

Table 3: List of countries/economies at each stage of development

Stage 1	Transition from 1 to 2	Stage 2	Transition from 2 to 3	Stage 3
Bangladesh	Armenia	Albania	Bahrain	Australia

efficient allocation of human and financial resources to their most effective use. In particular, labor markets are ranked 1st out of all countries, characterized by the ease and affordability of hiring workers and significant wage flexibility. The country's goods markets are also characterized by low levels of distortion within the context of a very competitive environment, providing consumers with a large selection of quality goods and services at reasonable prices, supplied in a timely manner. Financial markets are also rated as highly efficient, although in the context of the present financial crisis there has been a weakening of confidence in the financial sector, particularly the soundness of banks (40th this year, as opposed to 26th in 2007).

Although the country is thus very competitive overall, there are some weaknesses in more basic areas. Some aspects of its public institutions could be strength-

ened, with particular concerns on the part of the business community about the government's ability to maintain arms-length relationships with the private sector (40th), and in the perception that the government spends its resources wastefully (66th). The business costs of terrorism and of crime and violence more generally are also points of concern. But the country's greatest weakness is related to its macroeconomic stability, where it ranks a low 67th overall. The United States has built up large macroeconomic imbalances over recent years, with repeated fiscal deficits leading to rising and burgeoning levels of public indebtedness (reaching more than 60 percent of GDP by 2007, placing the country 102nd on this indicator). This indicates that the country is not preparing financially for its future liabilities and interest payments will increasingly restrict its fiscal policy freedom going into the future.

* One country that was included last year is not shown because of the lack of Survey data (Uzbekistan). This explains why the lowest rank in this column is 131.

Switzerland retains the same ranking as last year, second only to the United States. Similar to the United States, Switzerland's economy is characterized by an excellent capacity for innovation and a very sophisticated business culture, ranked 2nd for its business sophistication and 3rd for its innovation capacity. The country is characterized by high spending on R&D. Switzerland's scientific research institutions are among the world's best, and the strong collaboration between the academic and business sectors ensures that much of this research is translated into marketable products and processes, buttressed by strong intellectual property protection. This strong innovative capacity is captured by the high rate of patenting in the country, for which Switzerland ranks 6th worldwide on a per capita basis.

Switzerland's public institutions are rated among the most effective and transparent in the world (4th), ensuring a level playing field and enhancing business confidence, including an independent judiciary, a strong rule of law, and strong accountability of the public sector. Competitiveness is also buttressed by excellent infrastructure and labor markets that are among the most flexible in the world, both ranked 3rd overall. And Switzerland's macroeconomic environment receives excellent marks (ranked 10th), attributable to a government budget surplus, high national savings, low interest rates, and low inflation at a time when inflation is rising around the world.

On the other hand, the relatively low university enrollment rate—just shy of 46 percent—places the country 45th on this indicator. Efforts should be made to boost higher education attainment to provide more home-grown talent with the necessary skills for innovative activities.

The Nordic members of the European Union continue to hold privileged positions in the rankings.

Denmark is ranked 3rd, with **Sweden** and **Finland** following closely at 4th and 6th places, respectively, the same rankings as last year for all three countries. As in past years, the Nordic countries outperform the United States in a number of areas. For example, like Switzerland they receive among the best marks worldwide in terms of the macroeconomic environment, as they are also running healthy budget surpluses and have achieved very low levels of public indebtedness. The three countries have among the best functioning and most transparent institutions in the world, ranked only behind Singapore on this pillar.

Given the significant focus that the Nordic countries have placed on higher education and training over recent decades, it is not surprising that Finland, Denmark, and Sweden continue to occupy the top three positions in the higher education and training pillar. This has provided the workforce with the skills needed to adapt rapidly to a changing environment and has laid the ground for their high levels of technological adoption and innovation in recent years.

A marked difference among these three countries relates to labor market flexibility. While Denmark (ranked 4th) distinguishes itself as having one of the most flexible and efficient labor markets internationally, in Finland and Sweden, as is the case in a number of other European countries, companies have little flexibility in setting wages, nonwage labor costs remain very high, and firing and therefore hiring workers is deemed excessively expensive.

Singapore, at 5th place, is the top-ranked country from Asia on the strength of its institutional environment, moving up two places from last year as a result of a strengthening across all aspects of the institutional framework. Singapore also places among the top two countries for the efficiency of all of its markets—goods, labor, and financial—ensuring the proper allocation of these factors to their best use. Singapore also has world-class infrastructure, leading the world in the quality of its port and air transport facilities. But Singapore's overall ranking is constrained by its domestic market size and mixed performance in the macroeconomic stability pillar, where it ranks 59th and 121st for its interest rate spread and government debt, respectively.

Germany remains among the top-10 ranked countries, although it slips two positions to 7th place. The country is ranked 1st for the quality of infrastructure, with particularly good marks for its transport and telephony infrastructure. The efficiency of its goods and financial markets is another strength, buttressed by a very high level of business sophistication (ranked 1st on this pillar), although it should be noted that there has been a measurable decline in the business sector's assessment of the country's financial markets over the past year. These attributes allow Germany to benefit greatly from its significant market size (ranked 4th on this pillar). On the other hand, Germany's labor market continues to be very rigid (ranked 122nd on the labor market flexibility subpillar), where a lack of flexibility in wage determination, high nonwage labor costs, and the cost of firing provide a hindrance to job creation.

The Netherlands moves up two spots to 8th place and rounds out the list of the European countries in the top 10. The country's companies are highly sophisticated and are the most aggressive internationally in absorbing new technologies (ranked 1st for its technological readiness), buttressed by an excellent educational system and extremely efficient factor markets. The improvement in the rankings can be traced mainly to an even better assessment than last year of the functioning of its markets. The labor market in the Netherlands is notably efficient compared with the situation in many other European economies, and its goods market is ranked 3rd for its excellent functioning.

Japan, at 9th place, enjoys a major competitive edge in the areas of business sophistication and innovation, characterized by a high availability of scientists and engineers, high company spending on R&D, and an

excellent capacity for innovation (ranked 2nd on all three indicators). The country's overall competitive performance, however, is dragged down by its macroeconomic weaknesses, with an extremely high budget deficit (ranked 110th), which have led to the buildup of one of the highest public debt levels in the world (ranked 129th). Financial markets also remain an area of concern, traced to a lack of trust in the banking sector, for example (Japan ranks 93rd on the soundness of its banks). Japan's current ranking marks a drop of one position since last year, with a measurable weakening across a broad range of areas, most notably a number of aspects of the country's public institutions. In particular, the business community perceives that government spending has become more wasteful and public trust in politicians has diminished further since last year's assessment.

Canada moves up three places to join the top 10 (ranked 10th). Canada benefits from top-notch transport and telephony infrastructure; highly efficient markets, particularly labor and financial markets (ranked 7th and 10th respectively); and well-functioning and transparent institutions (ranked 15th). In addition, the educational system gets excellent marks for quality, which has prepared the country's workforce to adopt the latest technologies for productivity enhancements (ranked 9th). Canada's main weakness remains its macroeconomic stability, where it is ranked 43rd, mainly linked to the significant government debt of nearly 70 percent of GDP, which places the country 107th out of 134 countries on this indicator. On a more positive note, however, the government has been running small surpluses over recent years, which is allowing the country to put the debt level on a downward trend.

Europe

Europe continues to feature prominently among the most competitive regions in the world, with 12 European countries among the top 20, as follows: Switzerland (2nd), Denmark (3rd), Sweden (4th), Finland (6th), Germany (7th), the Netherlands (8th), the United Kingdom (12th), Austria (14th), Norway (15th), France (16th), Belgium (19th), and Iceland (20th). However, the picture for Central and Eastern Europe is bleaker, with several countries losing positions in the rankings echoing the recent economic downturn in the region.

The United Kingdom falls three positions to 12th place this year. Among the country's notable strengths is the efficiency of its labor market (ranked 8th), standing in contrast to the rigidity of many other EU countries. In addition, notwithstanding the recent financial crisis, the United Kingdom's financial markets continue to be assessed as among the most efficient in the world, although they have slipped from 2nd to 5th place since last year, attributable to rising concerns in the business sector about the soundness of banks and the ease of access to various forms of capital. The United Kingdom is also harnessing the latest technologies for

productivity improvements; it is ranked 8th on the technological readiness pillar. On the other hand, the country's greatest weakness remains its macroeconomic environment (ranked 58th), with low national savings, a growing public-sector deficit, and consequential public indebtedness. A more detailed analysis of the United Kingdom's competitiveness can be found in Box 1.

France is ranked 16th in this year's GCI, up two places from last year and demonstrating a number of competitive strengths. The country's infrastructure is among the best in the world (ranked 2nd), with outstanding transport links, energy infrastructure, and communications. The health of the workforce and the quality and quantity of education provision are other clear strengths (ranked 9th for health and primary education and 16th for higher education and training), ensuring a healthy and educated workforce. In addition, the sophistication of its business culture (9th in the business sophistication pillar) and its leadership in the area of technological innovation (16th in the innovation pillar) are important attributes that have helped to boost the country's growth potential.

On the other hand, a number of weaknesses are hindering the country from unleashing its competitive potential. France's labor market flexibility continues to be ranked very low (131st) because of the rigidity of wage determination, high nonwage labor costs, and the strict rules on firing and hiring, as well as the poor labor employer relations in the country. It is clear that structural reforms in this area, long mooted, are long overdue. Another area of concern is macroeconomic stability (65th): the government budget deficit and the related public-sector debt ratio remain large, and the national savings rate, while growing, still remains low by international standards.

In spite of the economic slowdown recently observed in **Spain**, the country remains stable at 29th place. Spain's competitiveness performance continues to be boosted by the large market (12th) available to its national companies; a highly sophisticated business sector (24th), which is effectively leveraging ICT and exogenous technology (29th in the technological readiness pillar); first-class infrastructure (22nd); good-quality higher education and training (30th); and strong macroeconomic fundamentals (30th). On a more negative note, its institutional environment (43rd) and innovation potential (39th) could be strengthened to further buttress its economic potential. And the greatest area of concern remains the highly inflexible labor market (126th), a matter of particular concern given the recently rising unemployment in the country.

On a less positive note, **Italy** (ranked 49th) is down by three places this year. The country continues to do well in more complex areas measured by the GCI, particularly the sophistication of its businesses environment. Italy is ranked 21st for its business sophistication, producing goods high on the value chain using the latest

Box 1: The United Kingdom: Ensuring its future competitiveness

Over the past decade, the United Kingdom (UK) has seen a period of rapid growth. GDP per capita increased more than in most European Union (EU) and G7 economies, and the country has undergone profound shifts as it took advantage of globalization. Yet despite this positive growth trend, the United Kingdom's ranking in the Global Competitiveness Index (GCI) has dropped by 10 positions since 2006, to 12th place this year.¹

There is no doubt that the UK economy benefits from a number of clear assets. Liberal policies in the area of trade and investment ensured efficient markets for goods and services through high levels of domestic and foreign competition. This in turn increased productivity. The country's highly sophisticated financial institutions took advantage of the increasing internationalization of financial flows to strengthen London's position as a key global financial center. The highly flexible and efficient labor markets, ranked 8th, enabled the shifting of workers from declining manufacturing industries to the rapidly growing services sector. As a result, unemployment was at a low 5.3 percent in 2006 despite considerable migration from Eastern Europe after the 2004 EU enlargement. All of these attributes contributed to healthy and stable economic growth over the past decade. Yet GDP growth in 2008 is now expected to be less than half the rate registered in 2007,² in large part because of the impact of the present financial crisis. This has highlighted the importance of addressing a number of challenges to improve the United Kingdom's competitiveness and better buttress the economy from future shocks.

Among the pillars of the GCI, the macroeconomic environment remains the weakest aspect of the UK competitiveness assessment. The United Kingdom ranks 58th on this pillar, down by 10 positions from last year. The significant and increasing budget deficit, ranked 105th and amounting to over 3 percent of GDP in 2007, has contributed to this worsening assessment. And although the 2008 budget is committed to tighter fiscal policy over the next two years, the efficiency as well as the quantity of spending are of concern: business leaders consider government spending to be increasingly wasteful, with the United Kingdom placing 76th on the related indicator, down from 40th last year. A recent OECD report echoes this perception,³ in particular for publicly funded services such as the health sector.⁴ Improving spending efficiency will be particularly important in the shorter term, because the current economic downturn is likely to decrease tax revenues.⁵ Over the longer term, the aging of the population will put additional pressures on the budget.

The institutions pillar is another component of the GCI that stands out for its fairly weak and deteriorating assessment in the case of the United Kingdom. The country places 25th this year, 12 positions below last year's ranking. The more fragile security situation following the 2005 terrorist attacks, and the threat of new attacks, impose significant costs on business, as reflected in the rank of 124 on the related indicator. More generally, the business community has less faith in government institutions than in the past: there is less trust in politicians, and a feeling that policymaking is more opaque.

As mentioned above, the financial markets remain one of the competitive advantages of the United Kingdom. However, compared with last year, there has been a notable weakening of this area as measured by the GCI. Specifically, the assessment of the overall sophistication of financial markets has dropped from 2nd to 5th place over the past year. This drop is linked to less easy access to various forms of capital and to rising concerns in the business sector about the soundness of banks (falling by 40 positions to 44th place), not surprising given the collapse or near collapse of significant financial institutions in the country. In response to this development, the government has initiated substantial changes to the financial regulatory framework.

Another area for reform, as indicated by the GCI, is the educational system. Enrollment rates in secondary and, to a lesser extent, tertiary education are below the average of the EU15 countries, ranking 34th and 26th, respectively. This may lead to skills shortages in the future, particularly as the quality of the educational system is not among the world's best, with overall quality ranked 28th and the quality of math and science education 47th. A more efficient use of talent could be achieved through efforts to increase social mobility, as the socioeconomic background of a student is currently quite decisive for his or her educational attainment.

In light of the present economic downturn, policy priorities will certainly focus on supporting a rapid return to past growth rates. Yet it is equally important not to neglect these fundamental challenges that undermine the country's underlying competitiveness and may put longer-term growth at risk.

Notes

- 1 The United Kingdom was 2nd in the 2006 edition of the GCI and 9th last year.
- 2 IMF 2008b.
- 3 OECD 2007.
- 4 In 2005 public expenditure on health amounted to 7.2 percent of GDP (OECD 2008).
- 5 Increasing efficiency is also a more appropriate policy response than fiscal tightening given the slowing economy.

production processes, thanks also to strong business clusters. However, Italy's overall competitiveness performance is held back by some critical structural weaknesses in the economy. The labor market remains among the most rigid in the world, with Italy ranked 129th out of 134 countries for its labor market flexibility, creating a large hindrance to job creation. Another problematic area is its weak public finances and extremely high levels of public indebtedness (ranked 123rd on this indicator), related to the inefficient use of public resources (it is ranked 128th for the wastefulness of government spending). Other institutional weaknesses are its high levels of corruption and organized crime and a perceived lack of independence within the judicial system, which increase business costs and undermine investor confidence.

Among the 12 countries that joined the European Union (EU) since 2004, **Estonia** (ranked 32nd) continues to be, by a significant margin, the most competitive economy, despite a fall of five places in the rankings since last year. Estonia has built up efficient government institutions (ranked 23rd) and well-functioning markets. The government manages public finances adeptly and has been successful in its efforts to make Estonia one of the most aggressive countries in adopting new technologies for productivity enhancements (17th). The drop in the country's ranking is mainly attributable to a lower government budget surplus and increasing inflation, and echoes the recent economic downturn in the Baltic region. This stands in contrast to **Bulgaria** (ranked 76th), one of the newest and the lowest ranked EU members. Bulgaria's low ranking is attributed, among other factors, to infrastructure inadequacies and institutional weaknesses including burgeoning corruption. However, on a positive note, Bulgaria has moved up four places in the rankings since last year, an improvement possibly linked to the perceived benefits brought about by accession, a trend also witnessed in **Romania** (up six positions at 68th position), the other new EU member since 2007.

Russia is ranked 51st, up seven places from last year. Russia's main strengths are its large market size and improving macroeconomic stability (partly thanks to windfall oil revenues). However, to improve its competitiveness further, the country must tackle a number of structural weaknesses. Of major concern is a perceived lack of government efficiency (116th), the lack of independence of the judiciary in meting out justice (109th), and more general concerns about government favoritism in its dealings with the private sector. Private institutions also get poor marks, with corporate ethics in the country placing Russia 112th overall on this indicator. In addition, goods and financial markets are inefficient by international standards (ranked 99th and 112th respectively). All these areas make it very difficult to do business in the country and should be addressed to place Russia on a more sustainable development path going forward.

After improving last year, **Turkey** (63rd) has dropped by 10 places in the rankings this year. Turkey continues to benefit from its large market, which is characterized by relatively high competition (46th). However, some more basic issues must still be tackled, such as upgrading the quality of infrastructure (especially ports and the electricity supply), improving the human resources base through better primary education and better health care (78th), addressing the burgeoning inefficiencies in the labor market (125th), and reinforcing the efficiency and transparency of public institutions. Indeed, there has been measurable decrease since last year in the public's trust in government institutions, demonstrated by a drop in rank from 57th to 82nd on this subpillar, likely related in part to recent political turbulence, such as the failed attempt to ban the ruling party. The overall drop in rank can also be traced to a weakening of the country's perceived financial market efficiency (which fell from 61st to 76th place), with a drying up of credit through the banking sector and increasing concerns about the soundness of banks more generally in the country.

Latin America and the Caribbean

As was the case last year, the important progress recently made by Latin America in improving its macroeconomic stability and ensuring more stable growth does not seem to be fully reflected in the competitiveness performance of the region, as appraised by the GCI.²¹ Only Chile, at 28th, continues to feature among the most competitive economies in the world, followed by the small Caribbean economies of Puerto Rico (41st) and Barbados (47th), and showing a significant gap with respect to the second highest ranked Latin American country, Panama (58th). Costa Rica (59th), Mexico (60th), and Brazil (64th) also figure in the top half of the rankings.

Chile remains at a comparatively high rank of 28, despite a fall of two places since last year, and is once again leading the region and most of the world in competitiveness. The country's remarkable success story has much to do with its sound macroeconomic management, coupled with timely market liberalization and opening to trade, all taking place within the context of a transparent and predictable regulatory framework. Specifically, Chile has successfully laid most of the basic foundations for competitiveness, including strong macroeconomic fundamentals (14th), well-developed infrastructure (30th), efficient institutions (37th), and a good health-care system (31st in the health subpillar). Moreover it displays efficient goods (26th) and labor (17th) markets, together with a fairly sophisticated financial market (29th), buttressed by the largest pension industry in the region (worth over 60 percent of GDP).²² All of these attributes have contributed to Chile's "Asian style" growth rates for the past 25 years.

The current challenge for Chile, which is bound to become even more pressing as the country moves up

the growth path and gets closer to the technological frontier, relates to the quality of its educational system. Both basic (105th) and higher (50th) education receive middling to poor marks, which bodes poorly for the country's capacity for knowledge generation and innovation. In particular, a well-functioning higher educational system producing a sufficient pool of skilled workers (especially scientists and engineers) is crucial not only to address the changing needs of an efficiency-driven production system, but also to provide the necessary environment for technology absorption. Although Chile has significantly increased its investment in education in recent years, accompanied by rising educational attainment rates, much remains to be done to catch up with the standards of countries such as Korea, Israel, and the European Nordic countries, presently the world leaders in this area.

Down five places from last year and now ranked 41st, **Puerto Rico** is the second highest ranked economy in Latin America and the Caribbean. The island's competitiveness continues to rest on its well-functioning goods (29th), labor (37th), and financial (30th) markets, coupled with a dynamic and sophisticated business sector (28th), which displays an important innovative potential (30th). Within the Caribbean, **Barbados** is also very successful by regional standards, moving up three places to 47th this year. The rather worrisome macroeconomic weaknesses displayed by the country

(114th) are counterbalanced by its excellent institutional environment (20th), first-class infrastructure (24th), and high-quality primary (5th) and higher (29th) education, among other factors.

Panama, fairly stable at 58th, and **Costa Rica**, up four positions to 59th, are the most competitive countries in Central America. Costa Rica, in particular, has showed an impressive upward trend in the past few years, gaining a total of nine positions since 2006. The country's main competitive advantages can be found in its fairly efficient institutions (50th), relatively good primary (36th) and higher (49th) educational systems, flexible labor markets (35th), and the impressive sophistication (42nd) and capacity for innovation (38th) displayed by its business sector. The country has also made important progress toward macroeconomic stability, improving its ranking significantly from 111th in 2007 to 85th in this area. For a more detailed analysis of Costa Rica's competitiveness performance, see Box 2.

Mexico, with a fairly stable score, loses eight positions from last year, and is now placed 60th. The country has made impressive strides toward macroeconomic stability (reflected in a relatively strong 48th position in the macroeconomic stability pillar) and toward opening, liberalizing, and diversifying its economy over the last decade, emerging as the second-largest economy after Brazil and the top FDI destination in the region.²³ Mexico has been able to leverage its privileged

Box 2: Costa Rica: A Central American success story in competitiveness

Blessed with rich natural resources and long standing political stability, Costa Rica is assessed by the GCI as one of the most competitive economies in Latin America and the Caribbean; at 59th position, it comes in ahead of Mexico (60th) and Brazil (64th), among others. Furthermore, an analysis of Costa Rica's evolution in the rankings over the last three years highlights a remarkable upward trajectory, with a nine-place improvement since 2006.

The unique development strategy followed by the country since its return to democracy in 1948 has allowed it to build up important competitive strengths, thus providing the rest of the region with best practices examples in dimensions as diverse as education, public governance, and product and export diversification.

The importance of good governance standards,¹ as well as high-quality education, are seen as prerequisites for a viable democracy, sustained growth and development. These elements have consistently underpinned the country's policy agenda over the decades. In particular, the early and steady focus on education, with the creation of the first public university in 1940 (the University of Costa Rica) followed by three more in the 1970s, and the establishment of world-class private higher edu-

cation and training and research institutions—such as INCAE, EARTH University, and INBio—equipped the productive system with a relatively large pool of highly qualified professionals.²

The policy agenda has placed particular emphasis on diversifying the economy away from commodities toward more value-added products. In this sense, Costa Rica has been particularly successful in nurturing its high-tech sector over the last 15 years, with high-tech exports accounting for 30 percent and 40 percent of total and industrial exports in 2006, respectively, and with a 13 percent rise in the 2001–05 period.³ The development of the high-tech sector has been boosted by the establishment in Costa Rica of an important group of multinationals in the 1990s, with Intel at the forefront, investing first in a large assembly and testing plant,⁴ and later in a software development center. Instrumental in bringing about this development have been the targeted FDI promotion strategy pursued by the national investment promotion agency CINDE, the export fiscal incentives (namely the Export Processing Zone and the Export Contract regimes) adopted in the 1990s in parallel with trade liberalization,⁵ and Costa Rica's geographical location and strong transportation logistics. Also critical have been the country's political stability and respect for the rule of the law, coupled

Box 2: Costa Rica: A Central American success story in competitiveness (*cont'd.*)

with the availability of a relatively low cost and educated labor force with good English language skills.

CINDE targeted high-tech FDI with a view toward diversifying Costa Rica's production structure away from agriculture and unskilled labor-intensive manufacturing (i.e., apparel produced in the *maquiladoras*), in which the country was already losing its competitiveness, to skill-intensive industries. This leveraged the country's educated labor force and ensured a more advantageous position in international markets. FDI was a crucial component of the cluster strategy envisaged by CINDE, since they were to develop backward linkages through the domestic suppliers and foster training and collaboration with national universities.

Another cluster that has been targeted and developed in a similar spirit of promoting higher value added industries is that surrounding the eco-tourism industry. Building on Costa Rica's extraordinary biodiversity (accounting for 5 percent of the world's total biodiversity), natural beauty, and pristine environment, the tourism sector has experienced an impressive dynamism in recent years, representing 6.3 percent of total GDP and 6.5 percent of total employment in 2007. Moreover, with 1.725 million tourist arrivals in 2007, bringing in an average US\$940 in receipts per visitor, Costa Rica leads Central America and displays a more lucrative tourism sector than Mexico, the most-visited country in Latin America (with 21.35 million visitors), for which the average receipt per visitor is only US\$570.⁶ It is not by chance that Costa Rica, at 44th, is the second highest ranking country in the LAC region, after Barbados (29th), in the World Economic Forum's Travel & Tourism Competitiveness Index 2008.

The fairly successful economic diversification described above feeds into strong levels of business sophistication (42nd) and innovation (38th), particularly by regional standards. Companies established in Costa Rica are operating quite high on the value chain (34th), with comparative advantages based predominantly on sophisticated products and processes (30th). Further, their innovation capacity is assessed as being fairly high (43rd), thanks to high R&D spending (30th) and wide-ranging research collaboration with academia (33rd). The country gets good marks in the innovation and sophistication factors subindex (39th), the best showing across the three subindexes composing the GCI, which bodes well for the preparedness of Costa Rica's economy to evolve toward a higher, innovation-driven, stage of development.

Furthermore, Costa Rica has made important progress in the macroeconomic aspects of competitiveness, consistently improving its public finances over the last three years: public debt has been brought down from 55.2 percent of GDP in 2005 to 46.6 percent in 2007, while the government budget balance has been turned from a 1.6 percent (of GDP) deficit in 2005 to a 0.6 percent surplus in 2007. This has been facilitated by the strong growth experienced by the country in the last couple of years, but is also indicative of the current government's effective tax administration, with reduced tax evasion and tight control on nonpriority spending.⁷

On a less positive note, inflation continues to be a source of concern at 9.4 percent in 2007, reflecting high oil and food

prices worldwide. Moreover, the poor state of the country's infrastructure (94th) looms as a potential bottleneck for the further modernization and diversification of the economy, as well as for its overall growth prospects. The adoption of fiscal reforms broadening the tax base should therefore be high on the government's agenda in order to free up important resources for investment in infrastructure and social programs, while not increasing the debt burden.

In addition, the long-awaited ratification of the Dominican Republic-Central American Free Trade Agreement (DR-CAFTA) could prompt the politically thorny liberalization of the telecommunications and insurance sectors, traditionally closed to private investors, thus enhancing their efficiency and eliminating important rigidities in the goods market.⁸ This should be done in parallel with efforts to reduce red tape and excessive regulation. This area remains a major concern in the country, as reflected by the disappointing marks registered by Costa Rica in aspects such as the number of procedures to start a business (12, corresponding to 103rd position), the time required to start a business (77 days, corresponding to 118th place), and the burden of government regulation (72nd).

By tackling such weaknesses, Costa Rica will further strengthen the foundations of its competitiveness and ensure sustained economic growth and prosperity going forward.

Notes

- 1 The focus on good governance is reflected in the comparatively good marks the country gets for several aspects of its institutional environment, in particular public ethics (41st), undue influence (34th), and government efficiency (47th). This stands in marked contrast with the performance of other countries in the region.
- 2 In this respect, Costa Rica is ranked 46th for its availability of scientists and engineers, only behind Puerto Rico (12th) and Chile (35th) in the region, and well above countries such as Argentina (81st), Peru (103rd), and Mexico (105th).
- 3 Reyes and Condo 2007.
- 4 Intel has invested a record US\$700 million since 1996 and is currently employing around 3,500 people in the country. The spillovers of Intel's investment in Costa Rica were many and diverse, ranging from a simplification of FDI regulation to creating specialized degrees in national universities and catalyzing further FDI in the country. In this respect, IT companies such as DSC Communications Corp., Remec, Sawtec Inc., Merrimac Industries, and Abbot and Baxter invested in the country, followed by Procter & Gamble, Western Union, and Sykes, which established service centers.
- 5 See Rodríguez-Clare 2001.
- 6 World Travel & Tourism Council, TSA Research 2007.
- 7 IMF 2008a.
- 8 Costa Rica was the last country among the signatories to ratify the DR-CAFTA, thanks to a narrow yes vote (51.6 percent) in a referendum called by President Arias in October 2007. Costa Ricans were bitterly divided on the agreement, because of the clauses imposing the liberalization and opening of the sensitive sectors of telecommunications, financial services, and energy.

geographical position between two oceans as well as between Latin and North America, its impressive network of preferential trade agreements, and its large domestic market of over 100 million people (ranked 12th in the world) to diversify its productive and export structure away from commodities: according to the Economist Intelligence Unit (EIU), 81 percent of Mexico's total exports in 2007 were in manufactures. This is also reflected by the country's fairly good marks for its business sophistication (58th), with reasonably developed clusters (58th), quality local suppliers (46th), and the fact that it has begun producing goods that are higher on the value chain (59th).

On the other hand, a number of important weaknesses continue to hinder Mexico's competitiveness. These include its weak public institutions (97th) and rampant violence (123rd). Also problematic is its inflexible labor market (99th), characterized by burdensome labor regulations and high payroll taxes and social contributions, as well as a higher education and training system (74th) that does not provide the economy with the appropriate pool of skilled labor, notably scientists and engineers (105th). In addition, the goods market suffers from inadequate (foreign and domestic) competition, with overregulated and closed key economic sectors such as telecommunications and energy. The current administration has managed to pass some bills aimed at addressing some of these concerns, including reforms in the pension, fiscal, electoral, and criminal justice systems and in the energy sector. However, further action is required to continue liberalizing markets, upgrade the educational system, and improve public governance in the country.

Brazil, at 64th place, posts a remarkable eight-position improvement, partially closing the competitiveness gap with Mexico. The country has continued to move in the direction of sounder public finances and has seen improvements in many of the areas assessed by the Index. In particular, government debt has been significantly reduced from last year (from 65.5 percent of GDP to 47 percent). Brazil's main competitive advantages include the large size of the market available to its firms (10th out of 134 economies), access to one of the most sophisticated financial markets in the region (64th), a dexterity in absorbing and adapting technology from abroad and leveraging ICT (56th in the technological readiness pillar), and especially the remarkable degree of sophistication displayed by its business sector (35th), together with a prowess for generating innovation (43rd). The latter two elements are reflected in the rapid internationalization of a number of Brazilian large enterprises that have become global players in the international markets, also massively investing abroad. In this sense, Brazil in 2006 was a net source of FDI, whereby the outward flows amounted to US\$26 billion vis-à-vis US\$18 billion of inflows.²⁴

Despite these encouraging trends, Brazil still faces important challenges in view of improving its competitiveness further. These include the still high debt levels (even after the reduction mentioned above), contributing to a low national savings rate and high interest rates, and a worrisome 122nd position in the macroeconomic stability pillar. There is also a general distrust of public institutions among the business community (98th), with weak public ethics (121st) and government inefficiencies (124th) as well as serious concerns regarding the security situation in the country (103rd). Educational standards also require upgrading (presently ranked 85th for primary education and 58th for higher education and training), with high dropout rates and large regional disparities in terms of attainment and quality. Last but not least, goods (101st) and labor (91st) markets are hampered by overregulation and important rigidities, which contribute to shifting a significant amount of activity and labor to the informal sector. Improvements in these structural and microeconomic weaknesses will better prepare Brazil to unleash its full competitive potential.

Peru is up three places to 83rd. This confirms the notable progress toward macroeconomic stability, based on a competent monetary and fiscal policy as well as goods and labor market liberalization, made by the country in recent years. Indeed, Peru has posted an important improvement since last year in the macroeconomic stability pillar (from 78th to 67th), due to increasing public surpluses (from 2.1 percent to 3.1 percent of GDP) and the related lowering of public debt (from 32.7 percent in 2006 to 29.2 percent of GDP in 2007). Peru has also seen improvements in the two pillars capturing goods and labor market efficiency (from 67th to 61st and from 87th to 75th, respectively). The country also continues to benefit from other competitive strengths, such as the reasonable size of its both foreign and domestic market (50th), and its fairly developed financial market (45th). Coupled with the high growth rates realized by the country in recent years,²⁵ as well as the investment grade status achieved in April 2008 for its foreign currency debt, the overall picture bodes well for Peru's competitiveness prospects. Going forward, a number of weaknesses will need to be addressed, including the poor quality of the country's institutional environment (101st), its underdeveloped infrastructure system (110th), and the inadequate state of health and primary education (95th) and higher education and training programs (89th). On a related note, poverty levels in Peru remain critical, despite the current administration's efforts to increase social expenditure and public investments in infrastructure.

Notwithstanding its strong recovery after the deep economic crisis of 2001, with high growth rates since 2003,²⁶ **Argentina** continues to place quite low in the rankings at 88th position, with an assessment similar to last year. The country has a number of important competitive advantages, including its relatively well educated

labor force (ranked 61st and 56th, respectively, on the health and primary education, and higher education and training pillars) and the large market size available to its enterprises (24th). However, the economy is characterized by some serious weaknesses, representing enduring elements of vulnerability going into the future. For example, despite debt restructuring, the public debt remains high, estimated at 56.1 percent of GDP in 2007 (placing the country 97th on this indicator); this, combined with continuing high inflation, may undermine the steps taken toward macroeconomic stability.

On a related note, the GCI highlights a deep distrust on the part of the business community regarding the quality and efficiency of the country's public institutions (128th), the respect and enforcement of the rule of law, and the even-handedness of the public sector in its relations with the private sector. This is likely linked to the government's tendency over recent years to adopt discretionary policies (such as the attempt to increase taxes on agricultural exports), coupled with the ongoing renegotiation of a number of utility provision contracts since 2001, eroding business confidence. Indeed, this tendency can also be seen in the country's overregulated and rigid goods (122nd), labor (130th), and financial (117th) markets, which are impeded from allocating resources to their most effective use. In this context, the most pressing challenges will be the institutionalization of sound fiscal policies and the restoration of investors' trust in the business climate and proper functioning of the economy.

Venezuela, at 105th place, continues to fall in the rankings, a trend seen over the past several years. This year the country has fallen seven more places despite some marginal improvements in its health and primary education standards and in the quality of the higher education and training system. This is due in large part to the fact that, despite windfall oil revenues, the macroeconomic environment continues to deteriorate: expansionary fiscal policies and discretionary administrative measures have led to increasing levels of public indebtedness and rampant and increasing inflation (ranked 132nd).

Related to the poor fiscal and monetary management, as last year, Venezuela ranks last out of all countries for the perceived quality of its institutions, reflecting the business sector's enduring concerns about the weak rule of law, government inefficiencies, and the government's lack of evenhandedness in its dealings with the private sector. There has been an increase in red tape, and goods, labor, and financial markets are not able to effectively allocate resources in the economy, with goods (132nd) and labor (131st) markets in particular assessed as among the least efficient in the world. Structural reforms are clearly needed to address the growing distortions in the economy and the high vulnerability to changes in oil prices. Competitiveness would also be improved if the increased public spending on health and

education were better targeted. Perhaps most important would be actions to restore investors' confidence in the business environment and the rule of law in the country.

Suriname (103rd), **Ecuador** (104th), **Bolivia** (118th), **Nicaragua** (120th), and **Paraguay** (124th) continue to figure at the bottom of the GCI rankings, displaying similar weaknesses in their poor institutional environments and lack of respect for the rule of law, excessive red tape and overregulated markets, underdeveloped infrastructure and inefficient educational systems.

Asia

The competitive performances of Asia-Pacific economies continue to encompass the entire gamut, from highly competitive countries to the most challenged. Singapore, Hong Kong (11th), and Australia (18th) continued their ascent in the rankings while Japan, Korea (13th), and Taiwan (17th) dipped in their positions. Nine Asia-Pacific countries are among the top 30, led by Singapore and followed by Japan, Korea, Hong Kong, Taiwan, Australia, Malaysia (21st), New Zealand (24th)—and this year China enters the top 30, displacing Thailand (34th). Other members of the next tier include new entrant Brunei (39th) as well as India (50th), Indonesia (55th), Vietnam (70th), the Philippines (71st), and Sri Lanka (77th). Pakistan (101st) declined in the rankings to join those countries ranked 100 and below, which include Mongolia (100th), Bangladesh (111th), Cambodia (109th), Nepal (126th), and Timor-Leste (129th).

Hong Kong SAR, at 11th place, leads the world in financial market sophistication and also benefits from very efficient goods markets and a high level of macroeconomic stability. With regard to financial markets, Hong Kong is ranked 1st for its legal rights, capital flows, and access to financing through the local equity market. And Hong Kong's goods markets are characterized by openness to foreign ownership, extremely low tariffs, and low trade barriers (ranked 1st in these indicators). The country ranks 3rd for its macroeconomic stability, due to its excellent fiscal management which has resulted in a notably low level of government debt, and an improving macroeconomic environment more generally.

On the other hand, Hong Kong's competitive disadvantages stem primarily from its small domestic market size and its mixed performance in the areas of health and primary education as well as higher education and training. On health, although life expectancy in the country is among the highest in the world, there are some concerns related to high rates of diseases such as tuberculosis (ranked 79th) and malaria (ranked 66th). And attainment rates remain quite low at all levels of the educational ladder, with primary, secondary, and tertiary enrollment rates so low as to place Hong Kong 101st, 72nd, and 63rd, respectively.

Korea, at 13th place, derives its strong position from attributes such as its macroeconomic stability and a very innovative business sector. Korea's macroeconomic

environment is characterized by government budget surpluses, which have led to the reduction of the public debt, a high national savings rate, and a very low interest rate spread (ranked 3rd on this indicator). The country is also highly innovative, with high company spending on R&D and a strong government focus on procuring advanced technology products (ranked 2nd), which have contributed to the country becoming one of the most innovative in the world (ranked 7th for utility patents). Korea's competitiveness would be strengthened further by addressing a number of weaknesses, most notably inefficiencies in its financial and labor markets.

Taiwan, China, at 17th place, down three places from last year, draws its greatest competitive strengths from its education sector and related business innovation. With regard to education, Taiwan has high enrollment rates at all levels, and the educational system gets good marks for quality (although the quality rating is weaker than in past years). In addition, companies provide a high level of continuing on-the-job training, ensuring that the workforce can adapt to the rapidly changing economy. Related to innovation, Taiwan has a large pool of scientists and engineers, and it benefits from high company spending on R&D and strong collaboration between research institutes and the business sector in innovation. All of this has come together to place Taiwan 1st worldwide in terms of the patenting per capita of new inventions.

On the other hand, Taiwan's financial markets represent a comparative weakness, with concerns about the soundness of banks (ranked 117th) and the restriction of capital flows (78th). Similarly, public institutions could be further strengthened. The drop of three places in the rankings is due in large part to a deterioration of various aspects of the institutional environment, with relatively low public trust in politicians, some concerns about a lack of judicial independence, and increasing complaints about the regulatory burden faced by companies operating in the economy.

Australia, at 18th place, draws its strongest competitive advantages from the excellent functioning of its goods, labor, and financial markets. In terms of financial market sophistication, the country ranks 3rd for the regulation of its securities exchanges and for legal rights, and 4th for the soundness of its banks. Australia's goods markets are characterized by the ease of starting a business: the number of procedures and the time required to start a business are both ranked 1st internationally. And labor markets are very flexible, characterized by significant ease in hiring and firing employees and a lack of nepotism in the business sector by international standards. Australia also has very strong private institutions, ranked 2nd for the efficacy of its corporate boards and 3rd for the strength of auditing and reporting standards in the country. Higher education and training is also an area of strength, with high enrollment rates at all levels, and

very good marks for the quality of the educational system (ranked 9th).

Malaysia, at 21st place, also benefits from the excellent functioning of its goods, labor, and especially financial markets. Labor markets are well evaluated for their efficiency (19th), with a strong relationship between productivity and pay (6th) as well as good cooperation in labor-employer relations (13th). Goods markets are assessed as efficient (23rd) with strong competition and business-friendly taxation. The financial market continues to perform well, clearly well recovered from the 1998 financial crisis, and is ranked 16th internationally for its sophistication, with a sound banking sector and a relative ease of access to various forms of finance for business development. Other strengths include the quality of the country's transport infrastructure and its strong business sophistication and innovative potential, which have contributed greatly to the country's growth over recent years.

On the other hand, efforts should be made in the area of education, where attainment rates at the secondary level remain low; and also in addressing the relatively poor health of the workforce. Finally, greater fiscal discipline would better ensure sustainable macroeconomic stability going into the future, with repeated government deficits (ranked 109th) to build up substantial government debt over the years.

New Zealand, at 24th place, benefits from the excellent health of its workforce as well as the high quality and quantity of education provided. The country also has transparent and well-functioning institutions—it is ranked 1st for its judicial independence, for example, and has very strong private institutions (ranked 3rd for the efficacy of corporate boards and 4th for the protection of minority shareholder interests). New Zealand's financial, goods, and labor markets are also highly efficient, with excellent investor protection and legal rights, low agricultural policy costs (ranked 1st on this indicator), few obstacles to starting a business, and very low trade barriers. The country's competitiveness would be enhanced by upgrading infrastructure, especially roads and the electricity supply.

China enters the top 30 this year, up four places from last year. The country benefits greatly from its large and rapidly growing foreign and domestic market size (ranked 1st and 2nd, respectively), allowing for significant economies of scale. Macroeconomic stability also remains a source of competitive advantage, with the government budget moving into surplus, and manageable debt levels, although rising inflation has become an area of concern, as in many other countries. Innovation is becoming another competitive advantage, with rising company spending on R&D coupled with strong university-industry research collaboration, and an increasing rate of patenting.

China's key competitive weakness is related to its financial market (109th), with restricted capital flows

(ranked 121st), inadequate regulation of securities exchanges (ranked 109th), and concerns about the soundness of the banking sector (ranked 108th). Related to these weaknesses is the need to strengthen private institutions (ranked 77th), with insufficient protection of minority shareholders' interests (ranked 94th), inefficient corporate boards (90th), and weak accounting and auditing standards (86th). And, given the increasing importance of innovation for the country's competitiveness, improving higher education and training should be a priority to address the low enrollment rates at the secondary and tertiary levels, and to upgrade the quality of the educational system more generally. See Box 3 for more details about China's competitive performance.

Thailand, ranked 34th, has fallen six places since last year. The country derives certain competitive strengths from its market size as well as the efficiency of its labor market (ranked 13th), the result of strong cooperation in labor-employer relations (ranked 17th) and low non-wage labor costs (ranked 20th), for example. The country's infrastructure is also very good, particularly roads and air transport. But the country lags in technological readiness (66th), with low penetration rates for Internet use, broadband, and mobile telephones in particular. The

health of Thailand's workforce is another area of concern (ranked 76th), with high rates of HIV, tuberculosis, and malaria (ranked 108th, 96th, and 93rd, respectively). Some aspects of the financial market also require attention, especially concerns about the soundness of the banking sector. Given the political turmoil experienced over the past year, it is notable that the decline in the overall ranking this year can be traced in part to a weakening assessment of government institutions, with increasing concerns about the transparency of policy-making and public-sector efficiency more generally.

Brunei Darussalam enters the rankings for the first time this year at 39th place, buoyed by its strong macroeconomic stability, where it ranks 2nd internationally, thanks to its high government surplus and the complete absence of public debt. However, important competitive disadvantages abound, particularly regarding the sophistication of business operations and strategy (ranked 97th) as well as innovation and goods market efficiency (ranked 91st in both pillars).

India, at 50th place, derives substantial advantages not only from its market size (ranked 4th for its domestic market size and 5th for its foreign market size) but also from its strong business sophistication (ranked 27th)

Box 3: China: An emerging giant in global competitiveness

With annual average growth rates of 9.7 percent since the late 1970s, China has made impressive strides in developing and diversifying its economy, as well as in reducing poverty and improving standards of living for its population.¹ Its enormous GDP, estimated at US\$3.3 trillion in 2007,² makes China one of the largest economies in the world, behind only the United States, Japan, and Germany, and an increasingly key player in the global economy. The size of the (domestic and export) market available to the companies established in its territory is second only to that of the United States globally, allowing extraordinary economies of scale and efficiency gains.

China ranks 30th in the Global Competitiveness Index (GCI) 2008–2009, up four positions from last year, entering the group of the 30 most competitive nations in the world, and well ahead the other three BRIC economies of India (50th), Russia (51st), and Brazil (64th).

This remarkable showing should not deemphasize the enormous challenges that face China in maintaining its competitiveness, in view of sustaining its rapid growth and moving up the value chain. As wealth is created, wages rise inexorably. Productivity must increase in line with rising prices and wages, as well the added value, quality, and diversity of the national production system. Practically, this means two things for China. First, the country must bolster the basic foundations of its competitiveness, namely the quality of its institutions, infrastructure, public health, and primary education, which are still very much

lagging behind international norms, while maintaining sound macroeconomic management. Further, it needs to improve its efficiency-enhancing factors, notably the quality of higher education and its capacity to leverage information and communication technologies (ICT) and other technologies coming from abroad, as well as the efficiency of the goods, labor, and financial markets.³

Starting from the basic requirements of competitiveness, the quality of the institutional environment appears to be improving in the country, as reflected by an encouraging 21-place improvement in the institutions pillar since 2007. Although business executives in China estimate that there has been a strengthening in property rights and intellectual property protection, as well as public ethics and government efficiency, the overall rank of 56 points to the need for further progress. In particular, the quality of private institutions remains a concern, notwithstanding a dramatic 41-position improvement (from 101st in 2007 to 60th this year). The assessments of the country's auditing and reporting standards (86th), the efficacy of corporate boards (90th), and the protection of minority shareholders (94th) indicate significant room for improvement.

China's macroeconomic environment remains fairly favorable, despite the recent trend of rising inflation (4.5 percent in 2007, up from 1.50 percent in 2006), due in large part to increasing food and commodity prices. The other macro indicators point in the right direction. In 2007, the government budget

(Cont'd.)

Box 3: China: An emerging giant in global competitiveness (cont'd.)

balance was back in the black with a surplus equivalent to 0.7 percent of GDP, compared with a deficit of 1.2 percent the previous year. The national savings rate reached a staggering 52 percent of GDP in 2007 and the interest rate spread is narrowing, while government debt is down to a low 18 percent of GDP. Sound public finances should provide the country with the resources needed to improve social services and to address social and geographical inequalities. Indeed, China faces the challenges of its economically lagging western and northeastern regions and of widespread absolute poverty, with approximately 128 million people living on less than a dollar per day, often without access to clean water or sufficient education and health services;⁴ this is reflected in the rather poor showing in the health subpillar (73rd).

In terms of efficiency enhancers, China presents some serious shortcomings, notably in the financial sector, ranked a dismal 109th this year. Efficiency and trustworthiness still lag behind in this area, with heavy restrictions placed on capital flows (121st) and inefficient and opaque stock exchange regulations (109th). The soundness of banks is assessed equally poorly, at 108th. Moreover, the country ranks 93rd for the extent to which borrowers' and lenders' rights are protected by law, as measured by the World Bank's Legal Rights Index. However, there are several encouraging signs. First, the government is aware of these issues and is taking major steps to tackle the problems, with some success as evidenced by the fact that the country is improving in eight of the nine indicators composing the pillar. Second, Chinese stock markets are large and active, based on a tremendous interest from national and international investors alike. It is expected that this will persuade the authorities of the need for more profound reforms.⁵ Finally, if access to stock markets remains problematic, private equity and venture capital, as alternative sources of financing, are expanding rapidly, as indicated by China's 22-position leap to 49th place for venture capital availability.⁶ Liberalizing, opening, and deepening financial markets should remain an absolute priority, in view of avoiding a potential bottleneck to China's further development.

Another area of weaknesses, although less severe, is China's level of technological readiness. This is critical for China's competitiveness given its present stage of development. ICT, in particular, enhances productivity through facilitating better production processes, and improves the efficiency of markets and resource allocation, thereby enhancing productivity. In addition, ICT has been shown to bring about important spillovers, notably for reducing poverty and social inequality. China lags behind its fellow BRIC countries in the technological readiness pillar, at a disappointing 77th place. The country ranks 83rd for availability of the latest technology, while foreign investment also is not viewed as an important source of new technology (79th). On a more positive note, Chinese firms seem to be relatively adept at adopting the technologies once they become available (46th). In terms of ICT infrastructure, penetration rates remain low by international standards, rendered more difficult by the large size of the Chinese population and land area. It is therefore encouraging that the government has placed ICT penetration high on its agenda of reforms through

various initiatives such as the Golden Projects for E-government.⁷

Domestic and foreign competition, despite some progress, is in need of further liberalization in order to improve goods market efficiency. Creating a business in China remains very burdensome and time consuming, and the effective total tax rate represents a staggering 74 percent of corporate profits, one of the highest rates in the world (120th). Trade barriers are also significant, with the effective trade-weighted tariff rate on imports at over 14 percent, placing China in 122nd position on this indicator. In addition, the labor market remains inflexible, with costly firing procedures (108th), and non-wage labor costs as high as 44 percent of an employee's salary, placing China 126th.

The general portrait of China's competitiveness as depicted by this year's GCI results is largely positive, with most indicators moving in the right direction. Nevertheless, it will become increasingly challenging to sustain its competitiveness. China is reaching a critical point in its development, when it can no longer rely solely on the abundance of low-cost inputs to sustain growth. At home, a growing middle class is becoming ever more discriminating, while international companies continue to shop around for the best cost-to-productivity ratio in deciding where to locate activities. For the time being, many factors—including the size of its market, increasing domestic demand, and numerous reforms—place China in a strong position to maintain its vigorous growth and navigate the troubled global economic landscape.

Notes

- 1 According to the World Bank (World Bank 2007), China alone has been responsible for 75 percent of poverty reduction in the developing world over the last two decades.
- 2 IMF 2008c.
- 3 In the Global Competitiveness Index, this reality is captured through the concept of stages of development: the importance of each determinant of competitiveness shifts as a country moves up along the value chain. See text for details. In 2005, China was still in the most basic, factor-driven, stage of development (GDP per capita inferior to US\$2,000). China has since entered a transition phase toward the second, efficiency-driven, stage (GDP per capita between US\$3,000 and US\$9,000), which, according to the IMF, China will reach by 2009.
- 4 World Bank 2008.
- 5 For instance, in May 2008, the total daily trading volume of the two main Chinese stock markets (Shanghai and Shenzhen) amounted to a record US\$41 billion, more than all the other Asian markets combined. See IASC 2008. Also, the value of Chinese initial public offerings reached US\$62.1 million in 2007, a world record. See World Bank 2008a.
- 6 According to a recent report by Deloitte (2007), China has become the primary target of American venture capitalists.
- 7 For more information, see World Bank 2007. For a detailed assessment of technological readiness across nations, see World Economic Forum 2008.

and innovation (ranked 32nd). The country is endowed with strong business clusters and many local suppliers, and ranks an impressive 3rd for the availability of scientists and engineers and 27th for the quality of its research institutions.

However, India's overall competitive position is weakened by its macroeconomic instability (109th) with the government running one of the highest deficits in the world (ranked 127th), unsustainable levels of government debt (ranked 113th), and fairly high inflation. Health and primary education is another area of concern, with poor health indicators (ranked 105th for both infant mortality and life expectancy), related to the high prevalence of diseases such as tuberculosis and malaria. Educational enrollment rates also remain low at all levels, with the primary educational system in particular getting poor marks for quality. Certain labor market efficiency indicators are also poor, including female participation in the labor force (ranked 122nd) and the facility with which firms can hire and fire employees (ranked 104th).

Indonesia, at 55th place, enjoys competitive advantage in selected areas, such as labor market efficiency, ranking 18th in pay and productivity and 19th in both cooperation in labor-employer relations and hiring and firing practices. In contrast, the country's main competitive weaknesses lie in the areas of technological readiness, infrastructure, and the quality of public institutions. With regard to technological readiness, Indonesia's penetration rates of ICT remain low (ranked 107th for Internet users, 105th for personal computers, and 100th for both mobile telephone subscribers and broadband Internet subscribers). The country's infrastructure also requires upgrading, with poor ratings for the quality of roads (ranked 105th) and ports (ranked 104th). Public institutions would also benefit from greater efficiency, with low rankings for the transparency of government policymaking (121st), the protection of property rights (ranked 117th), and intellectual property protection (102nd).

Kazakhstan is ranked 66th in this year's GCI, the highest ranked country in central Asia. Kazakhstan gets excellent marks for its labor market efficiency, which is ranked 12th worldwide, with high levels of flexibility in the hiring and firing process and in determining wages. Moreover, boosted by the country's natural resource wealth, it benefits from a number of macroeconomic strengths, including a balanced budget and a very low debt-to-GDP ratio. However, rising inflation, which has reached double digits, raises some cause for concern, placing the country 121st on this indicator. In addition, more will have to be done in Kazakhstan to improve the institutional environment. Particular attention should be focused on addressing weaknesses related to the quality of its institutions, notably judicial independence, the protection of property rights, government inefficiency, public trust of politicians, and security. A focus on

improving the health of the workforce and the quality of the educational system, and placing a greater focus on technological adoption, will also be important in the country's efforts to improve its competitiveness.

Vietnam, at 70th place, enjoys specific key advantages in various areas, particularly related to its relatively large market size and the functioning of its labor market, with strong female participation in the labor force (ranked 10th) and a strong relationship between pay and productivity in the economy (ranked 17th). But the country's overall competitive position is eroded by weaknesses in the quality of infrastructure and institutions, as well as in higher education and training. Vietnam's infrastructure gets a poor rating overall (93rd), especially with regard to roads and port facilities. In terms of the quality of its institutions, Vietnam suffers from burdensome government regulation and weak auditing and reporting standards, where it is ranked 105th and 106th, respectively. And given the increasing importance of innovation for the country's competitiveness, its low university enrollment rate (placing the country 106th) and the poor assessment of the quality of its educational system (ranked 120th) require urgent attention.

The **Philippines**, at 71st place, benefits from its relatively large market size (ranked 34th). In addition, the country has seen an improvement in its macroeconomic stability since last year, with a shrinking government budget deficit and lower public debt. On the other hand, the main obstacles to greater competitiveness are related to the quality of the country's public institutions and a lack of efficiency in its labor market. The institutional environment is characterized by the perception that government spending is highly wasteful (ranked 120th), a lack of evenhandedness in the government's dealings with the private sector (117th), and general concerns about corruption in the public sphere. In addition, the threat of terrorism imposes significant costs on businesses in the country (ranked 125th). With regard to labor market inefficiencies, wages are not flexibly determined by companies (108th), regulations impede firms from freely hiring and firing workers (101st), and firing costs are excessive (ranked 108th), all of which hinders job creation.

Sri Lanka, at 77th place, has fallen seven places since last year. The country suffers from macroeconomic instability, ranked a low 132nd on this pillar, with the government running budget deficits that are among the highest in the world (ranked 130th), leading to the buildup of high levels of public debt (nearly 84 percent of GDP, placing the country 118th on this indicator). In addition, lax monetary policy has produced the second to highest inflation rate of all countries covered bar Zimbabwe. Another area requiring urgent attention is Sri Lanka's labor market, which lacks flexibility and efficiency (ranked 115th overall), and is characterized by

high firing costs, low female participation in the labor force, and a very high total tax rate.

Pakistan, at 101st place, benefits from its large market size (ranked 29th overall). However, a number of competitive weaknesses are hindering its ability to fully benefit from the potential economies of scale, mainly related to the human resources base. Specifically, Pakistan's rankings are low in the pillars measuring health and primary education (116th), higher education and training (123rd), labor market efficiency (121st), and technological readiness (100th). In addition, there has also been a measurable weakening over the past year in the perceived quality of public institutions.

Cambodia at 109th, **Bangladesh** at 111th, **Nepal** at 126th, and **Timor-Leste** at 129th constitute the least competitive economies in the region. Many of the disadvantages are common to these countries, but there are variations in the degrees of weakness. For example, in Cambodia, competitive disadvantages manifest in the financial market (130th) and higher education and training (127th) pillars. In Bangladesh, weaknesses are most concentrated in institutions (127th) and technological readiness (126th) pillars. More generally, in order to improve their economic prospects, these countries need to make efforts across all areas, particularly those important for countries at the more basic stage of development.

Middle East and North Africa

Record oil prices coupled with sound policies over the past few years have buoyed economic growth across the Middle East and North Africa region. Business environment reforms, investment in infrastructure, and targeted diversification are now paying off in many countries through higher competitiveness rankings. The rising energy prices have benefited not only the hydrocarbon exporters, but have also generated spillover effects throughout the entire region through increasing intra-regional FDI.²⁷ However, while the Gulf economies tend to improve in the rankings this year, all North African countries and Israel lose positions.

As in previous years, **Israel**, at 23rd position, leads the regional ranking, despite a drop of six places since last year. The most significant area of weakening is linked to the country's public institutions, with increasing concerns about the protection of property rights (49th), inefficient government spending (60th), and a deteriorating public trust in politicians (61st), perhaps related to last year's conflict with the Lebanese Hezbollah as well as corruption allegations against the country's leading politicians over the past year.²⁸

Yet despite this more critical assessment of economic and political institutions, the country's well-developed human and institutional infrastructure for innovation, in particular at the early stage, as well as its widespread adoption of the latest technologies, continue to contribute to Israel's strong competitiveness and productive potential. Israel ranks 6th in terms of overall innovative

capacity, with excellent national research institutes (3rd) and the government taking a proactive role in procuring high-tech products. The success of the resulting research activity is reflected in the high rate of patenting per capita (5th) registered by Israeli residents. The well-developed financial markets play a key role in supporting the process of turning ideas into marketable products through facilitated access to venture capital (8th) and equity finance (14th).

The competitiveness of most **Gulf countries** covered by the GCI shows a robust upward trend. The most competitive among them, **Qatar**, 26th overall, has moved up by five places since last year, buoyed by the country's consistently well assessed institutions, but also by advances in the functioning of financial markets, as well as enhanced innovative capacity. The educational system has also received a better assessment than in previous years, possibly reflecting a signaling effect of the graduation of the first class from the Qatar Education City in early 2008, where many American universities have set up regional schools over the past few years.

Yet despite progress made in ensuring high-quality education, tertiary enrollment remains low given the country's advanced stage of development, and the economy remains characterized by a very low participation rate of women in the labor force. Another threat that could put Qatar's future competitiveness at risk is rising inflation, partly imported through the dollar peg and partly mirroring the economic boom on the peninsula as well as rising food prices. Inflation reached almost 14 percent in 2007, placing Qatar 129th out of 134 countries on this indicator.

Qatar is followed by **Saudi Arabia**, a country that has experienced a robust improvement by eight positions to place 27th this year, mirroring the government's determination to improve its performance on a number of competitiveness indicators under the ambitious 10x10 program (see Box 4 for more details on Saudi Arabia's competitive performance).

The **United Arab Emirates** confirms its position as one of the most competitive economies in the region, moving up by six positions to 31st place. Overall, the country improves its ranking across all pillars of the GCI, with a more stable macroeconomic environment and a better assessment of the educational system (at the basic and the advanced levels) as the main driving forces behind the significant improvement in the overall ranking.

The country's institutional environment remains, as in previous years, a competitive advantage, characterized by a low regulatory burden (5th), high public trust in politicians (8th), and reliable police services. Since the last edition of the *Report*, the macroeconomic environment in the Emirates has improved significantly to 24th place, with a narrowing interest rate spread testifying to a more efficient financial system. On the negative side, the country has one of the highest inflation rates in the world, ranked 123rd in international comparison. The

sources for increasing prices are to be seen in rising demand from investment projects and a quickly growing population of expatriates, as well as supply-side bottlenecks along with rising prices of imported goods, and in the dollar peg of the national currency.²⁹

The country's efforts to expand access to higher education through the creation of state universities, while also encouraging foreign and domestic private investment

in the sector, helped move the Emirates toward becoming a regional hub for higher education. Yet the share of young Emiratis attending higher-education institutions remains low by international standards, positioning the country at 79th overall. On the other hand, despite fairly low enrollment rates, the quality of education is improving in the eyes of the business sector, with the Emirates now ranking 33rd on this indicator.

Box 4: Saudi Arabia: Unleashing its competitive potential

In 2004, Saudi Arabia embarked on a visionary program aimed at turning the country into one of the most competitive economies worldwide by 2010, as measured by the three main indexes assessing the competitiveness of nations,¹ including the GCI. The framework, put into practice by the Saudi Arabian General Investment Authority and the newly created National Competitiveness Centre, encompasses reforms and investment that aim at diversifying the economy into industries where the country has comparative advantages in order to create 1.3 million jobs.² Major reforms in the areas of the investment climate, education, health, the financial sector, and the judiciary are envisaged or being implemented.

The progress made is reflected in this year's GCI, where Saudi Arabia moves up eight ranks from last year, placing 27th out of 134 countries. The most notable advances have been achieved with respect to the institutional framework for doing business, where the country moved from 41st to 34th, and the efficiency of goods markets, where it improved by 17 ranks, up from 51st to 34th. These results mirror recent reforms such as the greater ease of setting up new businesses and the overhaul of the judiciary, which has been initiated.

Yet despite those improvements, and alongside many competitive advantages—such as the stable macroeconomic environment, a solid institutional framework, and the large market size that allows for exploiting economies of scale—Saudi Arabia's assessment in the GCI points to important challenges that will have to be addressed if the country wants to move up the development ladder. In light of its ambitious goals, the question inevitably arises as to which are the most important remaining challenges to improving competitiveness. Three emerge from the analysis of the GCI results: a fairly weak educational system that prepares graduates insufficiently for jobs in the private sector, low levels of foreign competition, and underdeveloped financial markets.

Its low educational attainment has been Saudi Arabia's Achilles' heel for a long time. Aware of this weakness, the government has made impressive strides over the past decades toward increasing enrollment rates at all levels. Tertiary enrollment, for example, has tripled over the past 20 years.³ However, the quality of education in the country did not keep up with this development and remains weak by international standards. Business leaders' appraisal of the suitability of national education for a competitive economy is low, ranking only 70th. In par-

ticular, math and science education and management training are not considered adequate, ranked 85th and 75th, respectively. In addition, when asked to name the most problematic factors for doing business, Saudi business leaders point to an inadequately educated workforce as the most important factor, obtaining 15.7 percent of the responses. Restrictive labor regulations and poor work ethic of the national labor force are also mentioned among the important aspects, receiving 14.5 and 8.3 percent of the responses, respectively.

Improving the quality of education will therefore be crucial toward both resolving the employment shortage looming on the horizon and removing constraints to private-sector growth. Changing demographics are putting increasing pressure on labor markets, and the problem is likely to be exacerbated in the future. To date, over 80 percent of the native workforce have been absorbed by the public sector while the private sector mainly relies on migrant labor.⁴ Yet, with rising numbers of young Saudis entering the workforce every year,⁵ only a very dynamic private sector will be able to create sufficient jobs, and higher private-sector employment in turn necessitates a better alignment of educational content with the needs of the business sector. Upgrading the quality of education in Saudi Arabia is set to be a lengthy process, as it will require a thorough overhaul of the curricula and setting up more powerful incentive schemes for both teachers and students.⁶ The nexus of a fairly weak educational system, labor markets that rely on migrant labor and rapid population growth remains one of the most important challenges facing the Saudi society today, and addressing it will be crucial for ensuring social cohesion and securing current levels of prosperity for future generations.⁷

Despite WTO accession in 2005 and the increasing inflows of FDI, local business leaders consider Saudi Arabia to be fairly sheltered from foreign competition, as captured by the 82nd rank on the foreign competition component of the GCI. Barriers to trade remain fairly high, ranked 71st, with higher tariffs for agricultural products.⁸ At the same time, the country is considered to be fairly difficult to enter for foreign investors because of investor-unfriendly regulations: Saudi Arabia ranks a low 92nd in the corresponding variable, and 114th on the prevalence of foreign ownership. Despite efforts to attract investment into key industries, many sectors remain sheltered from foreign engagement, and transparency in the corporate sector is not widespread. Further lowering barriers to entry for foreign

(Cont'd.)

Box 4: Saudi Arabia: Unleashing its competitive potential (cont'd.)

goods, services, and capital would intensify competition in the country, thereby raising the efficiency of the domestic economy.

Saudi Arabia's financial sector has been undergoing a major overhaul since 2002. The competition among banks was intensified by allowing foreign banks to set up branches in the country, legal gaps are being filled, and regulation has been reformed—in particular for capital markets and Islamic finance. In addition, greater transparency requirements for banks have strengthened bank supervision. Nevertheless, business leaders are assessing the financial sector as insufficiently meeting the needs of a competitive economy. Although credit and other forms of finance, such as venture capital, are fairly easily accessible, the overall level of sophistication is assessed low by international standards (63rd). In this respect, the poor assessment of the trustworthiness of the financial system, positioning at a low 98th rank, is noteworthy. Within this category, the legal system obtains low marks for its ability to protect investors (93rd). This is certainly a reflection of the fact that, until recently, the Saudi judicial system was ill adapted to protect commercial interests. The situation is set to improve in the wake of the recent judicial reform. In addition, despite progress made in the regulation of securities exchanges, business leaders assess its quality, ranked 88th, as not sufficient. Although new regulatory standards have been recently introduced, the implementation of these laws is lagging behind. The gradual opening of the Saudi stock market to foreigners may provide additional pressure for more transparency and a more consistent implementation of existing regulations.

Notes

- 1 In addition to the GCI, these measures include the *Doing Business* report of the World Bank and the *World Competitiveness Yearbook* published by IMD.
- 2 The reform program includes the construction of six so-called *economic cities* set up as special economic zones throughout the country that will provide modern infrastructure and a business environment free of red tape. These cities should also ensure equitable development in all regions.
- 3 Despite great progress achieved, Saudi Arabia's current ranking in terms of enrollment in tertiary education remains fairly low by international standards (70th).
- 4 World Bank 2008b.
- 5 According to ILO data (ILO 2008), about 515,000 people are entering the workforce in the first decade of the new millennium, as opposed to about 415,000 in the 1990s and about 635,000 in the 2020s.
- 6 Saudi Arabia has one of the highest education expenditure-to-GDP ratios in the world, and a high teacher-to-pupil ratio. For more information on the challenges the Saudi educational system is facing, see World Bank 2008b.
- 7 Related to this challenge is the enormous untapped opportunity of increasing women's participation in the labor force (Saudi Arabia ranks 134th on this variable).
- 8 WTO 2008.

The positive developments in innovation, technological readiness, and business sophistication bode well for the country's future and reflect the business leaders' optimism about the prospects going forward. The use and penetration of ICTs and other advanced technologies are widespread and are increasingly catching up with the rest of the world, allowing the country to move up in the rankings to 28th position in this area. Yet, although the country's firms are producing goods and services increasingly high on the value chain and are engaging more in marketing and distribution (21st and 38th rank, respectively), businesses still do not rely sufficiently on professional management (52nd). At the same time, the fairly low quality of research institutions (74th) and companies' low spending on R&D (50th), as well as shortages in qualified research staff (75th), constrain the strengthening of the innovative capacity, which, at 46th, remains far behind top international levels.

Kuwait ranks 35th in this year's edition of the GCI. The country's macroeconomic environment remains for the second year in a row the most favorable worldwide. A budgetary surplus of nearly 44 percent of GDP (the highest of all countries), the highest national savings rate, and extremely low government debt contribute to this excellent result. Yet in order to put the country's recent surge in growth on a more solid footing, Kuwait must continue to carry out structural reforms. A major priority will be an overhaul of the educational system, both in terms of providing more access and also in improving its quality. Kuwait ranks 81st and 106th, respectively, for the quantity of higher and primary education, and 83rd for the quality of education provided. More generally, business leaders perceive the educational system to be out of sync with the needs of a competitive economy, with math and science education highlighted in particular as needing improvement. In addition, further intensifying domestic competition by facilitating the entry of foreign firms and new business creation would benefit the country's competitiveness. This would allow the business sector to take advantage of the flexible labor market and inject new energy into the country's markets for goods and services.

Tunisia tops the rankings among the North African countries at 36th position, preceding Bahrain and Oman by a narrow margin. The country's institutions, which have been favorably assessed for a number of years, are one of its major competitive advantages. They rest on fairly transparent and trustworthy relations between the government and the civil society as expressed in the high public trust of politicians (16th), a favorable assessment of the efficiency of government spending (2nd), and transparent policies (15th), as well as limited favoritism on the part of government officials (14th). A well-functioning health and educational system, as well as sound levels of domestic competition (34th) and a strong innovative capacity (27th), round out the positive picture. Moving forward, Tunisia will need to focus on

reforming the rigid labor market (ranked 103rd) and further streamlining its macroeconomic management in order to improve its competitive position.

Bahrain and **Oman** rank 37th and 38th, respectively. Similar to most of their geographical neighbors, both countries improve this year (by six and four positions, respectively). As is the case within many countries in the region, prudently managed hydrocarbon wealth has ensured a stable macroeconomic environment in both economies. While Oman displays a solid institutional environment, the GCI results point to shortcomings in the educational system that will need to be addressed if the country wishes to advance its competitiveness. Bahrain is host to the most sophisticated financial market in the region, but needs to further improve the efficiency of its labor market and upgrade its innovative capacity.

Jordan occupies the 48th rank this year, much in line with previous years' assessments. Well-defined property rights (23rd), efficient government spending (26th), a low burden of government regulation (18th), and a fairly efficient legal framework (29th), coupled with a very safe and secure environment (14th) ensure that the country's institutions receive a positive assessment. At the same time, the country's weak and deteriorating macroeconomic position is worrying, ranked a low 111th, 11 positions lower than last year, with a growing budget deficit and accompanying debt level. Moving forward, Jordan should also address its low primary education enrollment rate, which could otherwise lead to a literacy gap that will become increasingly difficult to close over time. In addition, policies aimed at making the labor market more flexible would also be beneficial for the country's business sector and employment creation.

Morocco has fallen by nine ranks this year, to 73rd place, in line with the deteriorating performance of North Africa as a whole. In the case of Morocco, a weakening security environment and a deteriorating assessment of the quality of the educational system contribute to the country's declining competitive position. At the same time, the macroeconomic environment—traditionally one of the country's weaknesses—has improved because of laudable efforts to curb inflation, control spending, and streamline the tax collection system.³⁰ The country also boasts a regulatory environment that is conducive to business activity and to business creation, ranked 19th and 22nd for the number of procedures and time required to start a business. At the same time, the rigid labor market, assessed at a low 128th rank, remains a serious drag on the country's competitiveness.

Syria, at 78th position, has moved up by two ranks since last year. Syria is a still largely state-controlled economy that only recently embarked on a reform path. The successful reforms of the business environment are reflected in the relatively favorable and improving assessment of institutions, although business leaders still identify corruption (100th) and the lack of transparency

of government policymaking (106th) as major shortcomings. Tighter monetary policy has helped to curtail inflation, which nevertheless still remains at a relatively high level (ranked 88th),³¹ while the high government budget deficit (121st) further undermines macroeconomic stability (93rd). As well as imposing more fiscal and monetary discipline, moving forward, Syria should also focus on upgrading higher education and training institutions (101st), freeing up the very rigid labor market (123rd), and continuing to reform its financial institutions (121st).³²

Egypt ranks 81st in this year's edition of the GCI, down four places compared with last year. Despite some improvements, macroeconomic instability remains a major challenge for the government as mirrored in the very low 125th rank the country obtains on this pillar. High government debt, double-digit inflation, and a still high—although decreasing—budget deficit continue to weaken the macroeconomic environment, despite improving fiscal management.³³ In addition, labor market efficiency is poor in international comparison, ranked last among all 134 countries. Firing costs (119th), a significant brain drain of the country's talent (129th), and reliance on friends and relatives for professional management positions (124th) are the most important weaknesses in this context.

At the same time, Egypt has made progress in fostering technological readiness (84th), although the increased penetration of the latest technologies, such as the Internet, PCs, and mobile telephones, has not been sufficient for the country to move up in the rankings, as other countries are improving more quickly. To further benefit from internationally available technology, Egypt will need to upgrade its educational institutions, which continue to receive weak assessments (124th).

Libya ranks 91st, down three positions since the last edition of our *Report*. Benefiting from increasing exports of hydrocarbons, the country boasts one of the strongest macroeconomic environments in the world (ranked 6th). The high government surplus and low government debt contribute to this good assessment. Yet mounting inflationary pressures are putting the country's macroeconomic stability at risk. Although educational enrollment rates are overall satisfactory, the curricula need to be overhauled to become more in line with the needs of present economic realities: the quality of the educational system receives one of the weakest assessments among all countries covered (121st). Similarly, the quality of infrastructure is assessed as dismal, in particular air transport (126th), ports (110th), and railroads (116th). In this context, to improve its competitiveness, windfall oil profits should be invested in structural improvements such as upgrading the educational system and the transport infrastructure.

Algeria has dropped 18 positions to 99th rank, and is now the weakest regional performer. Despite robust growth reaching on average 4.8 percent over 2003–07,³⁴

and relative macroeconomic stability, the business sector assesses the operating environment in the country as more difficult than in previous years, in particular with respect to public and private institutions as well as innovative capacity. Trust in politicians is eroding, as business leaders see the institutional framework deteriorate and the already precarious security situation worsen.³⁵ In addition to upgrading the institutional environment, improving the country's competitive position will require reforms in what is one of the most rigid labor markets in the world (132nd) and a restructuring of the very inefficient and unstable financial system (132nd). Labor market reforms could also contribute to improving the security situation by creating more jobs for the rising numbers of fairly well educated yet unemployed young people.

Sub-Saharan Africa

The improving economic climate observed in sub-Saharan Africa in recent years, with annual GDP growth accelerating to 6.8 percent in 2007 according to the IMF, is at last being reflected in the improved competitiveness rankings of a number of countries in the region. South Africa and Mauritius, already in the top half of the rankings last year, have been joined by Botswana, and there have been measurable improvements across specific areas in a number of other African countries. However, notwithstanding this positive development, sub-Saharan Africa as a whole continues to lag behind the rest of the world in competitiveness, requiring efforts across many areas to place the region on a firmly sustainable growth path going forward.

South Africa, ranked 45th overall, remains the highest ranked country in sub-Saharan Africa, with a very stable performance. Among the country's strengths is the large size of the economy, particularly by regional standards (ranked 23rd in the market size pillar). The country continues to receive good marks in more complex areas measured by the GCI, such as intellectual property protection (23rd), the quality of private institutions (25th), and goods (31st), as well as financial market efficiency (24th), business sophistication (33rd), and innovation (37th). South Africa benefits from high spending on R&D, accompanied by strong collaboration between universities and the business sector in innovation (both ranked 28th). It is thus not surprising that in recent years the country has a higher rate of patenting than a number of European countries. These combined strengths explain South Africa's position at the top of the regional ranking.

However, South Africa does face a number of obstacles to competitiveness. For example, the country ranks 88th in labor market flexibility, encompassing hiring and firing practices (129th), flexibility of wage determination (123rd), and poor labor-employer relations (119th). Further, the country's innovative potential could be at risk with a university enrollment rate of only 15

percent, which places the country 93rd overall. South Africa's infrastructure, although good by regional standards, requires upgrading (ranked 48th), with particular concerns about the quality of the electricity supply that has been getting worse in recent years (ranked 101st, down from 83rd last year) and the short supply of telephone lines. The poor security situation remains another important obstacle to doing business in South Africa. The business costs of crime and violence (134th) and the sense that the police are unable to provide protection from crime (109th) are highlighted as particular concerns. The greatest obstacle, however, remains the health of the workforce, ranked 129th out of 134 countries, due to high rates of communicable diseases and poor health indicators more generally. These are areas that must be tackled in order to improve South Africa's competitiveness outlook.

Botswana, ranked 56th, follows only South Africa in sub-Saharan Africa. The country regains its position this year in the top half of the rankings, moving up a remarkable 20 places, the largest improvement this year. In this light, the GCI is beginning to weight more heavily those more complex factors from which Botswana derives its competitive strengths. The government has succeeded in using its wealth from key natural resources to invest in factors that have set it on a more sustainable growth trajectory. Among the country's strengths are its reliable and legitimate institutions, ranking a high 21st worldwide for the efficiency of government spending, 22nd for public trust of politicians, and 26th for judicial independence. Botswana is rated as the country with the lowest corruption in Africa (22nd out of 134 countries). Over past years, the transparency and accountability of public institutions have contributed to a stable macroeconomic environment, and this is one key area of improvement: the government has been running a healthy budget surplus, which is allowing it to reduce debt levels, and inflation has come down from its peak in 2006 as well.

Botswana's primary weaknesses are related to the country's human resources base. Despite high spending on education, educational attainment rates at all levels of the educational ladder remain low by international standards, and the quality of the educational system receives mediocre marks. Yet it is clear that by far the biggest obstacle facing Botswana in its efforts to improve its competitiveness is the health situation in the country. Botswana has the highest HIV prevalence rate of all countries covered, as well as very high malaria (111th) and tuberculosis (128th) incidence. However, these rates are for the most part coming down, leading to an improvement in life expectancy from 40 to 52 years by the most recent estimate. Continuing to improve the health and educational levels of the workforce will remain the main priorities for the government for some time.

Mauritius has seen an improvement of three places since last year, moving up to 57th position and following Botswana directly in the rankings. The country is characterized by strong and transparent public institutions, with well-protected property rights (ranked 22nd), reasonable levels of judicial independence, and a security situation that is good by regional standards (37th). Private institutions are rated as accountable and improving, with strong auditing and accounting standards and a system that protects minority shareholders' interests. The country's infrastructure is well developed by regional standards, and goods and financial markets function well, ensuring an efficient allocation of resources in the country.

However, efforts will be required in the area of education. Educational attainment rates remain low, particularly at the university level (placing Mauritius 90th), education spending remains low, and the educational system gets mediocre marks for quality. Beyond the educational weaknesses, labor markets could be made more flexible, with stringent hiring and firing laws (110th) and wages that are not flexibly determined (118th). Furthermore, there are some health concerns with regard to the workforce—particularly the high prevalence of HIV. Finally, Mauritius must work to improve the stability of the macroeconomic environment going forward (ranked 117th), with a government budget deficit that places the country 115th (which over time has led to the buildup of significant national debt and high interest rates), as well as high and rising inflation.

Namibia has moved up nine places to 80th place this year, with improvements across many of the areas measured by the GCI. Among Namibia's comparative strengths is the quality of the institutional environment (ranked 42nd). Property rights are well protected (ranked 25th) and the judiciary is perceived as independent from undue influence (22nd). With regard to private institutions, auditing and accounting standards are strong and minority shareholders' interests are well protected. The country's strong institutional environment continues to contribute to responsible macroeconomic management. The government budget remained in surplus between 2006 and 2007, helping to significantly relieve the country's debt burden, although rising inflation still remains high by international standards (ranked 83rd on this indicator). The quality of the country's infrastructure is also excellent by regional standards (ranked 33rd), most particularly the transport infrastructure.

With regard to weaknesses, Namibia's health and education indicators are worrisome, with the country ranked a low 124th on the health subpillar. The country is characterized by high infant mortality, low (albeit rising) life expectancy, the result in great part of the high prevalence rates of HIV and malaria (ranked 130th and 129th, respectively) as well as the second-to-highest incidence of tuberculosis of all 134 countries. On the educational side, attainment rates remain low, with primary, secondary, and tertiary enrollment rates placing

the country 114th, 103rd, and 112th, respectively. The quality of the educational system is assessed as being among the worst of all countries in the Index, ranked 114th overall, despite high government per capita spending on education. In addition, Namibia's goods markets suffer from a number of distortions, such as a long time required for starting a business (99 days, placing the country 122nd), ineffective antitrust policy, and poor customer orientation. Finally, the country could do more to harness new technologies to improve its productivity levels. Companies are not considered to be sufficiently aggressive in absorbing new technologies, and Namibia has low penetration rates of new technologies such as mobile phones and the Internet.

Notwithstanding the post-election political and social turmoil ravaging the country earlier in the year, **Kenya** (ranked 93rd overall) has moved up by six places this year, with its key strengths found in the more complex areas normally reserved for countries at higher stages of development. For example, Kenya's innovative capacity is ranked an impressive 42nd, with high company spending on research and development, and good scientific research institutions collaborating well with the business sector in research activities. Supporting this innovative potential is an educational system that—although educating a relatively small proportion of the population compared with most other countries (primary, secondary, and tertiary enrollment rates are ranked 116th, 108th, and 126th, respectively)—gets good marks for quality (33rd) for those attending schools. The economy is also supported by financial markets that are sophisticated by international standards (44th), with relatively easy access to loans and share issues on the local stock market.

However, there are a number of basic weaknesses that are eroding at Kenya's overall competitive potential. The country's public institutions continue to be assessed as highly inefficient (100th), plagued by undue influence (111th) and high levels of corruption (101st). The security situation in Kenya is also extremely worrisome, particularly crime and violence (126th), the potential of terrorism (129th), and the prevalence of organized crime (118th). Health is another area of serious concern (ranked 117th), with a high prevalence of diseases—particularly tuberculosis and HIV, which are among the highest of all countries covered (124th and 125th, respectively), contributing to the low life expectancy of 53 years.

Nigeria is ranked 94th this year. The country's greatest area of strength remains the macroeconomic environment (ranked 26th), with windfall oil revenues contributing to large (although declining) government budget surpluses, and a high national savings rate. Nigeria also benefits from a relatively large market, allowing for economies of scale. In addition, its financial markets are quite sophisticated by regional standards (ranked 54th).

On the other hand, the GCI shows that Nigeria's economy is characterized by weak and deteriorating institutions (ranked 106th, down from 87th in 2006)—including a serious security problem (125th)—and poor assessments for its infrastructure (120th) as well as basic health and education (126th). In addition, the country is not harnessing the latest technologies for productivity enhancements, as demonstrated by its low levels of ICT penetration. The rankings show that Nigeria is not taking the opportunity presented by the windfall oil revenues to upgrade the population's access to basic health care and education, and to make improvements in other areas such as infrastructure. Movements in this direction would be critical to set the basis for sustainable growth going forward.

Zimbabwe continues to be ranked among the least competitive economies included in the GCI, second to last at 133rd overall. This compares with last year's rank of 129, and represents a decline of one place even in a constant sample. The institutional environment is among the worst of all countries, with a complete absence of property rights (ranked last out of all countries at 134th), high levels of corruption (130th), and a lack of even-handedness of the government in its dealings with the public (129th) as well as basic government inefficiency (130th). The extreme mismanagement of the public finances and monetary policy has placed Zimbabwe once again at the bottom of all countries covered with regard to macroeconomic stability (ranked 134th), with enormous—and growing—deficit spending, negligible national savings, and raging hyperinflation that is unparalleled anywhere else in the world. The economy is now characterized by mismanagement and weaknesses across all areas, including health (ranked 128th in the health subpillar), low educational enrollment rates, and official markets that have ceased to function for all intents and purposes (particularly goods and labor markets, ranked 133rd and 127th, respectively).

Conclusions

This chapter has presented and analyzed the results of the World Economic Forum's Global Competitiveness Index. Covering 134 countries in this year's edition, the GCI provides a comprehensive picture of the numerous factors, institutions, and policies that determine the productivity and prosperity of a nation.

Since its introduction in 2004, the GCI has been used by an increasing number of countries and institutions to benchmark national competitiveness. The clear and intuitive structure of the GCI framework is useful for prioritizing policy reforms as it allows countries to determine the strengths and weaknesses of the national competitiveness environment and to identify those factors most constraining its economic development.

At the national level, numerous entities—such as competitiveness councils and observatories—have been

created to analyze and closely monitor the competitiveness performance of their countries, and several national competitiveness reports have been prepared based on the GCI framework. At the global level, international organizations specializing in economic development studies increasingly use the GCI alongside other methodological approaches, as a tool for identifying and prioritizing areas for growth-enhancing reform.

In this context, the particular strength of the World Economic Forum's competitiveness work is that it provides a platform for dialogue among government, business, and civil society that can serve as a catalyst for productivity-raising reforms, with the aim of boosting the living standards of the world's citizens.

- 2 See, for example, Sala-i-Martin et al. 2004 for an extensive list of potential robust determinants of economic growth.
- 3 See Acemoglu et al. 2001, 2002; Rodrik et al. 2002; Easterly and Levine 1997; and Sala-i-Martin and Subramanian 2003.
- 4 See de Soto 2000.
- 5 See de Soto and Abbot 1990.
- 6 See Shleifer and Vishny 1997; Zingales 1998.
- 7 See Kaufmann and Vishwanath 2001.
- 8 See World Bank 1994; Gramlich 1994; Aschauer 1989; Canning et al. 1994; and Easterly 2002.
- 9 See Fischer 1993.
- 10 See Sachs 2001.
- 11 See Schultz 1961; Becker 1993; Lucas 1988; and Kremer 1993.
- 12 It is important to note that the effects of the global financial crisis may not be fully reflected in the GCI results discussed in this chapter, as they are based on data from the past year.
- 13 See Aghion and Howitt 1992 and Barro and Sala-i-Martin 2003 for a technical exposition of technology-based growth theories.
- 14 A general purpose technology (GPT), according to Trajtenberg (2005), is one which in any given period makes a particular contribution to overall economy's growth thanks to its ability to transform the methods of production in a wide array of industries. Examples of GPTs have been the invention of the steam engine and the electric dynamo.
- 15 See Frenkel and Romer 1999; Rodrik and Rodriguez 1999; Sachs and Warner 1995; and Alesina et al. 2005.
- 16 This is particularly important in a world in which economic borders are not as clearly delineated as political ones. In other words, when Belgium sells goods to the Netherlands, the national accounts register the transaction as an export (so the Netherlands is a foreign market of Belgium), but when California sells the same kind of output to Nevada, the national accounts register the transaction as domestic (so Nevada is a domestic market of California).
- 17 See Romer 1990; Aghion and Howitt 1992; and Grossman and Helpman 1991.
- 18 Probably the most famous theory of stages of development was developed by the American historian W.W. Rostow in the 1960s (see Rostow 1960). Here we adapt Michael Porter's theory of stages (see Porter 1990). Please see Chapter 1.1 of *The Global Competitiveness Report 2007–2008* for a complete description of how we have adapted Michael Porter's theory for the present application.

- 19 Some restrictions were imposed on the coefficients estimated. For example, the three coefficients for each stage had to add up to one, and all the weights had to be non-negative.
- 20 In order to capture the resource intensity of the economy, we use as a proxy the exports of mineral products as a share of overall exports according to the sector classification developed by the International Trade Centre in their Trade Performance Index. In addition to crude oil and gas, this category also contains all metal ores and other minerals as well as petroleum products, liquefied gas, coal, and precious stones. Further information on these data can be found at the following site:
<http://www.intracen.org/menus/countries.htm>.
- All countries that export more than 70 percent of mineral products are considered to be to some extent factor driven. The stage of development for these countries is adjusted downward smoothly depending on the exact primary export share. The higher the minerals export share, the stronger the adjustment and the closer the country will move to stage 1. For example, a country that exports 95 percent of mineral exports and that, based on the income criteria, would be in stage 3, will be in transition between stage 1 and 2. The income and primary exports criteria are weighted identically. Stages of development are dictated uniquely by income for countries that export less than 70 percent minerals. Countries that export only primary products would automatically fall into the factor-driven stage (stage 1).
- 21 According to the IMF (IMF 2008b), the region has withstood rather well the global financial slowdown so far, also thanks to strong commodity prices, with a still solid 5.6 percent growth rate in 2007. This is projected to slow gradually to 4.4 percent and 3.6 percent respectively in 2008 and 2009.
- 22 OECD Development Centre 2007.
- 23 Attracting US\$19.04 billion in FDI in 2006 (UNCTAD 2007), ahead of Brazil (US\$18.78 billion) and Chile (US\$7.95 billion).
- 24 OECD Development Centre 2007.
- 25 These growth rates are an average annual 6.5 percent of GDP in the 2003–2007 period according to the IMF (2008a).
- 26 Argentina experienced average annual growth of 8.8 percent from 2003 to 2007 IMF (2008a).

This appendix presents the structure of the Global Competitiveness Index 2008–2009 (GCI).

The numbering of the variables matches the numbering of the Data Tables. The number preceding the period indicates to which pillar the variable belongs (e.g., variable 1.01 belongs to the 1st pillar).

The hard data indicators used in the GCI are normalized on a 1-to-7 scale in order to align them with the Executive Opinion Survey's results.^a The Technical Notes and Sources at the end of this *Report* provide detailed information on all the hard data indicators.

Those variables that are followed by the symbol ^{1/2} enter the GCI in two different places. In order to avoid double counting, we give them a half-weight in each place by dividing their value by 2 when computing the aggregate score for the two categories in which they appear.^b

The percentage next to each category represents this category's rounded weight within its immediate parent category. The computation of the GCI is based on successive aggregations of scores, from the variable level (i.e., the lowest level) all the way up to the overall GCI score (i.e., the highest level), using the weights reported below. For example, the score a country achieves in the 9th pillar accounts for 17 percent of this country's score in the *Efficiency enhancers* subindex. Similarly, the score achieved on the subpillar *Networks and supporting industries* accounts for 50 percent of the score of the 11th pillar. Reported percentages are rounded to the nearest integer, but exact figures are used in the calculation of the GCI.

Unlike for the lower levels of aggregation, the weight put on each of the three subindexes (Basic requirements, Efficiency enhancers, and Innovation factors) is not fixed. It depends on each country's stage of development, as discussed in the text.^c For instance, in the case of Ecuador—a country in the second stage of development—the score in the *Basic requirements* subindex accounts for 40 percent of its overall GCI score, while it represents just 20 percent of the overall GCI score of Denmark, a country in the third stage of development.

Weight (%) within immediate parent category

BASIC REQUIREMENTS

1st pillar: Institutions.....25%

A. Public institutions75%

- 1. Property rights.....20%
 - 1.01 Property rights
 - 1.02 Intellectual property protection^{1/2}
- 2. Ethics and corruption.....20%
 - 1.03 Diversion of public funds
 - 1.04 Public trust of politicians
- 3. Undue influence20%
 - 1.05 Judicial independence
 - 1.06 Favoritism in decisions of government officials
- 4. Government inefficiency20%
 - 1.07 Wastefulness of government spending
 - 1.08 Burden of government regulation
 - 1.09 Efficiency of legal framework
 - 1.10 Transparency of government policymaking
- 5. Security.....20%
 - 1.11 Business costs of terrorism
 - 1.12 Business costs of crime and violence
 - 1.13 Organized crime
 - 1.14 Reliability of police services

B. Private institutions25%

- 1. Corporate ethics50%
 - 1.15 Ethical behavior of firms
- 2. Accountability.....50%
 - 1.16 Strength of auditing and reporting standards
 - 1.17 Efficacy of corporate boards
 - 1.18 Protection of minority shareholders' interests

2nd pillar: Infrastructure.....25%

A. General infrastructure50%

- 2.01 Quality of overall infrastructure

B. Specific infrastructure50%

- 2.02 Quality of roads
- 2.03 Quality of railroad infrastructure
- 2.04 Quality of port infrastructure
- 2.05 Quality of air transport infrastructure
- 2.06 Available seat kilometers (hard data)
- 2.07 Quality of electricity supply
- 2.08 Telephone lines (hard data)

3rd pillar: Macroeconomic stability.....25%

- 3.01 Government surplus/deficit (hard data)
- 3.02 National savings rate (hard data)
- 3.03 Inflation (hard data)^d
- 3.04 Interest rate spread (hard data)
- 3.05 Government debt (hard data)

(Cont'd.)

Appendix A: Structure of the Global Competitiveness Index 2008–2009 (cont'd.)

4th pillar: Health and primary education25%

A. Health.....50%

- 4.01 Business impact of malaria^e
- 4.02 Malaria incidence (hard data)^e
- 4.03 Business impact of tuberculosis^e
- 4.04 Tuberculosis incidence (hard data)^e
- 4.05 Business impact of HIV/AIDS^e
- 4.06 HIV prevalence (hard data)
- 4.07 Infant mortality (hard data)
- 4.08 Life expectancy (hard data)

B. Primary education50%

- 4.09 Quality of primary education
- 4.10 Primary enrollment (hard data)
- 4.11 Education expenditure (hard data)^{1/2}

EFFICIENCY ENHANCERS

5th pillar: Higher education and training17%

A. Quantity of education33%

- 5.01 Secondary enrollment (hard data)
- 5.02 Tertiary enrollment (hard data)
- 4.11 Education expenditure (hard data)^{1/2}

B. Quality of education33%

- 5.03 Quality of the educational system
- 5.04 Quality of math and science education
- 5.05 Quality of management schools
- 5.06 Internet access in schools

C. On-the-job training33%

- 5.07 Local availability of specialized research and training services
- 5.08 Extent of staff training

6th pillar: Goods market efficiency17%

A. Competition67%

1. Domestic competition.....variable^f
 - 6.01 Intensity of local competition
 - 6.02 Extent of market dominance
 - 6.03 Effectiveness of anti-monopoly policy
 - 6.04 Extent and effect of taxation^{1/2}
 - 6.05 Total tax rate (hard data)^{1/2}
 - 6.06 Number of procedures required to start a business (hard data)⁹
 - 6.07 Time required to start a business (hard data)⁹
 - 6.08 Agricultural policy costs
2. Foreign competitionvariable^f
 - 6.09 Prevalence of trade barriers
 - 6.10 Trade-weighted tariff rate (hard data)
 - 6.11 Prevalence of foreign ownership
 - 6.12 Business impact of rules on FDI
 - 6.13 Burden of customs procedures
 - 10.04 Imports as a percentage of GDP (hard data)

B. Quality of demand conditions33%

- 6.14 Degree of customer orientation
- 6.15 Buyer sophistication

7th pillar: Labor market efficiency17%

A. Flexibility50%

- 7.01 Cooperation in labor-employer relations
- 7.02 Flexibility of wage determination
- 7.03 Non-wage labor costs (hard data)
- 7.04 Rigidity of employment (hard data)
- 7.05 Hiring and firing practices
- 6.04 Extent and effect of taxation^{1/2}
- 6.05 Total tax rate (hard data)^{1/2}
- 7.06 Firing costs (hard data)

B. Efficient use of talent50%

- 7.07 Pay and productivity
- 7.08 Reliance on professional management^{1/2}
- 7.09 Brain drain
- 7.10 Female participation in labor force (hard data)

8th pillar: Financial market sophistication17%

A. Efficiency50%

- 8.01 Financial market sophistication
- 8.02 Financing through local equity market
- 8.03 Ease of access to loans
- 8.04 Venture capital availability
- 8.05 Restriction on capital flows
- 8.06 Strength of investor protection (hard data)

B. Trustworthiness and confidence50%

- 8.07 Soundness of banks
- 8.08 Regulation of securities exchanges
- 8.09 Legal rights index (hard data)

9th pillar: Technological readiness17%

- 9.01 Availability of latest technologies
- 9.02 Firm-level technology absorption
- 9.03 Laws relating to ICT
- 9.04 FDI and technology transfer
- 9.05 Mobile telephone subscribers (hard data)
- 9.06 Internet users (hard data)
- 9.07 Personal computers (hard data)
- 9.08 Broadband Internet subscribers (hard data)

10th pillar: Market size17%

A. Domestic market size75%

- 10.01 Domestic market size index (hard data)^h

B. Foreign market size25%

- 10.02 Foreign market size index (hard data)ⁱ

INNOVATION AND SOPHISTICATED FACTORS

11th pillar: Business sophistication50%

A. Networks and supporting industries50%

- 11.01 Local supplier quantity
- 11.02 Local supplier quality
- 11.03 State of cluster development

B. Sophistication of firms' operations and strategy 50%

- 11.04 Nature of competitive advantage
- 11.05 Value chain breadth
- 11.06 Control of international distribution
- 11.07 Production process sophistication

Appendix A: Structure of the Global Competitiveness Index 2008–2009 (cont'd.)

- 11.08 Extent of marketing
 11.09 Willingness to delegate authority
 7.08 Reliance on professional management^{1/2}

12th pillar: Innovation.....50%

- 12.01 Capacity for innovation
 12.02 Quality of scientific research institutions
 12.03 Company spending on R&D
 12.04 University-industry research collaboration
 12.05 Government procurement of advanced technology products
 12.06 Availability of scientists and engineers
 12.07 Utility patents (hard data)
 1.02 Intellectual property protection^{1/2}

e The impact of malaria, tuberculosis, and HIV/AIDS on competitiveness depends not only on their respective incidence rates, but also on how costly they are for business. Therefore, in order to estimate the impact of each of the three diseases, we combine its incidence rate with the Survey question on its perceived cost to businesses. To combine these data we first take the ratio of each country's disease incidence rate relative to the highest incidence rate in the whole sample. The inverse of this ratio is then multiplied by each country's score on the related Survey question. This product is then normalized to a 1-to-7 scale. Note that countries with zero reported incidence receive a 7, regardless of their scores on the related Survey question.

f The *Competition* subpillar is the weighted average of two components: *Domestic competition* and *Foreign competition*. In both components, the included variables provide an indication of the extent to which competition is distorted. The relative importance of these distortions depends on the relative size of domestic versus foreign competition. This interaction between the domestic market and the foreign market is captured by the way we determine the weights of the two components. Domestic competition is the sum of consumption (C), investment (I), government spending (G), and exports (X), while foreign competition is equal to imports (M). Thus we assign a weight of $(C+I+G+X)/(C+I+G+X+M)$ to *Domestic competition*, and a weight of $M/(C+I+G+X+M)$ to *Foreign competition*.

g Variables 6.06 and 6.07 combine to form one single variable.

h The size of the domestic market is constructed by taking the natural log of the sum of the gross domestic product valued at PPP plus the total value (PPP estimates) of imports of goods and services, minus the total value (PPP estimates) of exports of goods and services. Data are then normalized on a 1-to-7 scale. PPP estimates of imports and exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP. The underlying data are reported in the Data Tables section.

i The size of the foreign market is estimated as the natural log of the total value (PPP estimates) of exports of goods and services, normalized on a 1-to-7 scale. PPP estimates of exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP. The underlying data are reported in the Data Tables section.

Notes

- a The standard formula for converting hard data is the following:

$$6 \times \frac{(\text{country score} - \text{sample minimum})}{(\text{sample maximum} - \text{sample minimum})} + 1$$

The *sample minimum* and *sample maximum* are, respectively, the lowest and highest country scores in the sample of countries covered by the GCI. In some instances, adjustments were made to account for extreme outliers. For those hard data variables for which a higher value indicates a worse outcome (e.g., disease incidence, government debt), we rely on a normalization formula that, in addition to converting the series to a 1-to-7 scale, reverses it, so that 1 and 7 still corresponds to the worst and best possible outcomes, respectively:

$$-6 \times \frac{(\text{country score} - \text{sample minimum})}{(\text{sample maximum} - \text{sample minimum})} + 7$$

- b For those groups of variables that contain one or several half-weight variables, country scores for those groups are computed as follows:

$$\frac{(\text{sum of scores on full-weight variables}) + \frac{1}{2} \times (\text{sum of scores on half-weight variables})}{(\text{count of full-weight variables}) + \frac{1}{2} \times (\text{count of half-weight variables})}$$

- c As described in the chapter, the weights are the following:

Weights	Factor-driven stage (%)	Efficiency-driven stage (%)	Innovation-driven stage (%)
Basic requirements	60	40	20
Efficiency enhancers	35	50	50
Innovation and sophistication factors	5	10	30

- d In order to capture the idea that both high inflation and deflation are detrimental, inflation enters the model in a U-shaped manner as follows: for values of inflation between 0.5 and 2.9 percent, a country receives the highest possible score of 7. Outside this range, scores decrease linearly as they move away from these values.

Moving to a New Global Competitiveness Index

MICHAEL E. PORTER, Harvard University

MERCEDES DELGADO, Institute for Strategy and Competitiveness, Harvard Business School, and Fox School of Business, Temple University

CHRISTIAN KETELS, Institute for Strategy and Competitiveness, Harvard Business School

SCOTT STERN, Kellogg School of Management, Northwestern University

The Global Competitiveness Report (GCR) has long been a globally recognized ranking of country competitiveness and a tool for benchmarking country strengths and weaknesses. In an effort to continually introduce the best available methodology in preparing the rankings, there has been a series of improvements in the methodology over the years. An important milestone was reached in 2000, when Professor Jeffrey Sachs introduced the Growth Competitiveness Index, based on a stronger academic foundation in economic growth theory. Professor Michael Porter joined the effort in 2000, introducing a companion Business Competitiveness Index (BCI) focused on the microeconomic drivers of prosperity. In 2004, Professor Xavier Sala-i-Martin created a Global Competitiveness Index (GCI), which included both macroeconomic and microeconomic factors of competitiveness. Since 2004, the GCI has been published in the GCR alongside the BCI.

This year, the World Economic Forum and Professor Porter have embarked on another important stage in the development of the GCR. Under Professor Porter's leadership, the aim is another step-change improvement in both the Index methodology and the quality of the Executive Opinion Survey (the Survey), which provides many proprietary data used in preparing the *Report*. This chapter previews the upcoming changes in the Index, while Chapter 2.1 discusses the considerable improvements that have already been implemented in the Survey process.

The aim of the New Global Competitiveness Index (New GCI) is to create a single, fully integrated index to replace the two indexes published in recent years. The New GCI will be based on a single model that is firmly grounded in the latest academic research while designed to extend research and yield practical insights for policy-makers. The New GCI will also create a stable methodological platform for the years to come.

The New GCI will concentrate on the determinants of the productivity level that a national economy can sustain, which is the ultimate driver of national prosperity. Data will continue to be drawn from a mix of public sources and the unique and proprietary annual Survey of many thousands of business executives from around the world. The majority of the individual indicators used in the previous indexes will be incorporated into the new index.

While many of the elements stay the same, the New GCI incorporates them in a new and more robust conceptual structure. It will also employ a new and more rigorous statistical methodology.

To develop the new index, Professor Porter assembled a team of scholars including Professor Scott Stern

The authors would like to acknowledge invaluable guidance from Professor Antonio Ciccone, Universitat Pompeu Fabra, and essential data analysis by Rich Bryden, from the Institute for Strategy and Competitiveness. We are also grateful to the World Economic Forum's Global Competitiveness Network team for helpful comments.

of Northwestern University, Professor Antonio Ciccone of Universitat Pompeu Fabra, Professor Mercedes Delgado of Temple University, and Dr. Christian Ketels of the Institute for Strategy and Competitiveness at Harvard Business School. The New Index is largely developed, and will be rigorously tested over the coming year. An advisory group of outside experts will review the New Index and make recommendations for improvements. The official launch of the New GCI will coincide with the 2009 *Global Competitiveness Report*.

Assessing a country's competitiveness is a challenging task because of the sheer number and variety of influences on national productivity. Correlation among many of the indicators makes disentangling the impact of individual indicators complex from a statistical standpoint. It is precisely because of these challenges, as well as the fact that most studies highlight a subset of influences rather than seek a comprehensive model, that the academic literature has not achieved consensus on the causes of productivity. Different datasets and alternative econometric approaches have led to different and often conflicting claims about the specific drivers of competitiveness.¹ The aim of the New GCI is to deal with these challenges in a way that is rigorous, pragmatic, and designed to inform policymakers at a detailed level.

This chapter provides an overview of the New Index, its structure and methodology, and some of its overall findings. While the details will evolve, we wanted to provide a preview to inform scholars and practitioners of the new approach and invite dialog about the proposed methodology and its implications.

The foundation of competitiveness

Prosperity is determined by the productivity of an economy, which is measured by the value of goods and services produced per unit of the nation's human, capital, and natural resources. Productivity depends both on the value of a nation's products and services, measured by the prices they can command in open markets, and the efficiency with which these products can be produced. Productivity supports high wages, a strong currency, and attractive returns to capital—and with them a high standard of living.² Competitiveness, then, is measured by productivity.

The world economy is not a zero-sum game. Many nations can improve their prosperity if they can improve productivity. Improving productivity will raise the value of goods produced and improve local incomes, expanding the global pool of demand to be met. Globalization has increased the returns to productivity by opening up large new markets for competitive countries. Globalization has also raised the costs of low productivity, by reducing the ability to sustain low-productivity companies or provide high-paying jobs for less-skilled employees. The central challenge for any economy is to create the con-

ditions in which companies and employees throughout the economy can upgrade their productivity.

Identifying the drivers of productivity (and ultimately prosperity) across countries is one of the oldest occupations of economic research. Theoretical models initially concentrated on the role of capital accumulation in economic growth.³ Over the last decades, they have focused increasingly on the role of knowledge.⁴

Empirical research, enabled by new datasets covering an ever increasing range of indicators, has tested the impact of a wide range of these possible productivity drivers. Important categories of productivity drivers highlighted have included the role of institutions, openness to trade and investment, geographic location, and the quality of the business environment. While there is broad agreement on some general findings, no consensus model has yet emerged on the specific drivers of productivity and their relative importance. Results tend to be highly dependent on the specifics of the sample of countries chosen and the actual measures used.⁵ These findings have led to debate about policy implications.⁶

The New GCI framework is grounded in this literature, but aims to provide an integrative overall framework while capturing detailed local circumstances at the country level that are actionable by policymakers. Much academic work focuses on a minimum set of root causes that statistically explain the differences in current prosperity levels across countries, such as a nation's colonial past. The New GCI aims to identify the proximate drivers of current prosperity at a level that can be addressed by policy, even if these drivers may have been influenced by history.

Theory and empirical evidence suggest that many things matter for competitiveness. The New GCI framework incorporates a comprehensive set of these factors, rather than isolating a few factors that are econometrically most efficient in predicting prosperity levels. Our aim is to capture the rich set of influences on productivity that will allow policymakers to understand country strengths and weaknesses and craft a policy agenda.

Some national conditions, such as the quality of public institutions, are general conditions that create opportunities for higher productivity across the economy that may or may not be realized. Other factors, such as the average skill level of the labor force, directly affect productivity. Differences in the mechanism of influence often coincide with the policy process that governs them: general conditions affecting productivity tend to be under the control of national governments, while many direct productivity drivers are often the result of involvement by many parts of government, the private sector, academia, and other institutions.

Within broad categories, such as physical infrastructure or financial market sophistication, we find that there is a high degree of correlation between individual factors. Thus, improving a country's position is a matter of improving groups of interrelated factors, not just

Figure 1: Defining competitiveness

influencing one or two isolated weaknesses. The New GCI framework deals with this issue through an econometric approach that reveals the common movements of related factors instead of imposing weights that treat factors as separate.

Elements of the New GCI framework

The aim of the New GCI is to reveal the underlying causes of productivity. There are three overall building blocks of the framework: endowments, macroeconomic competitiveness, and microeconomic competitiveness. Endowment affects prosperity directly through inherited natural resources, geographic location, or a large home market. Endowment is a control variable in explaining prosperity.

Competitiveness is what determines the productivity with which a nation's endowments are used to create goods and services. Competitiveness arises from both macroeconomic and microeconomic factors. These are captured in detail in the New GCI.

Productivity

The dependent variable used in estimating the New GCI model is the level of GDP per capita, adjusted for purchasing power parity (PPP). GDP per capita is the broadest measure of national productivity and is strongly linked over time to a nation's standard of living. It is the single best summary measure of country performance available across all countries. It provides continuity with the BCI model of previous years. The focus on productivity reflects our goal of identifying the determinants of sustainable prosperity, whether they operate through inputs such as skills and capital or through the efficiency with which these inputs are employed. Focusing on

Figure 2: Foundations of productivity

inputs and efficiency separately is problematic because of conceptual as well as practical issues. Conceptually, they are not determined independently.⁷ Practically, the calculation of inputs and efficiency levels is subject to significant data limitations.

Endowments

The New Index explains productivity rather than becoming co-mingled with resource abundance. Controlling for endowments allows the New GCI to distinguish between prosperity and productivity. Inherited prosperity from, for example, oil resources, is captured in the control. The competitiveness indicators then explain the created wealth from productive economic activity that adds value to available labor and natural assets.

The empirical growth literature has generally revealed a negative influence of natural resource abundance on prosperity levels, summarizing the evidence using the term *resource curse*.⁸ The traditional justification for this counterintuitive finding—access to valuable resources seemingly should have a positive effect on prosperity—has been the Dutch Disease. Here, revenues from natural resource exports lead to an appreciation of the real exchange rate that, in turn, drives factors of production into local activities such as retailing that have lower long-term potential for productivity growth. An additional justification for the resource curse is the role of institutions: natural resource wealth has a negative effect on the quality of political institutions and economic policy, eroding competitiveness over time.⁹

A country's geographic location is another endowment that has been discussed as a possible external factor influencing wealth. Location can affect the ease with which countries can engage in trade, for example, because of having a long coastline,¹⁰ or because of distance from

Figure 3: Macroeconomic competitiveness

large markets.¹¹ Another locational dimension of endowments is the proximity to the equator and climatic conditions that expose a country to tropical diseases and might lead to lower agricultural productivity.¹²

Finally, there is a widespread view that another type of endowment, country size and population, affects prosperity. While there is little empirical evidence on direct effects of country size on growth, there is evidence of some effects such as the greater effect of openness to trade on prosperity for small countries than for large countries.¹³ Some evidence suggests that the level of agglomeration is related to prosperity for poor countries, but the findings are not yet very robust.¹⁴

Macroeconomic competitiveness

Macroeconomic factors operate indirectly to affect the productivity of firms in an economy. They are necessary, but not sufficient, for higher productivity.

The New GCI framework distinguishes two broad areas of macroeconomic competitiveness: macroeconomic policy (MP) and social infrastructure and political institutions (SIPI). These areas reflect two key strands in the macroeconomic growth and prosperity literature. Macroeconomic policy has dominated the debate for a long time,¹⁵ while recent literature has put more emphasis on institutions.¹⁶ There is an emerging consensus that institutions have a strong effect on productivity, especially when accounting for their endogenous effects on other economic and social policies.

Macroeconomic factors are heavily the province of central governments. In most areas of macroeconomic competitiveness, there is broad consensus on best practices in managing the policy levers available. Achieving high levels of macroeconomic competitiveness is thus largely a matter of achieving these best practices and

sustaining them over time, often in the face of political opposition by interest groups hoping to benefit from different policies.

Macroeconomic policy has been the central focus of the economic policy debate in most countries.¹⁷ Fiscal and monetary policy, each a separate area of academic research, are included in the New GCI framework. Although many countries achieve similar levels of performance on fiscal and monetary policies, differences exist and can sometimes persist.¹⁸

Fiscal policy—that is, government spending and financing decisions—is primarily discussed in terms of its impact on short-term fluctuations of economic activity. In terms of its impact on long-term differences in productivity across locations, researchers have distinguished between the role of the absolute size of the government and the growth of government spending, and the patterns of raising government revenues over time. More prosperous countries tend to have a larger share of government spending in GDP, a relationship first noted by German economist Adolph Wagner in the 19th century.¹⁹ This is true because the demand for public goods such as infrastructure and social security systems increases with overall prosperity. However, there is significant variance of government budgets among countries at similar stages of development. Recent analysis has focused more on the nature of financing, notably the impact of different patterns of taxation on overall prosperity.²⁰ The literature suggests that, within normal parameters, the overall size of government (and implicitly the level of taxes) is less important than the way government spends money (government efficiency) and the way taxation is structured (distortiveness and bureaucratic burden of taxes).

The sustainability of government financing over time is another factor with potential impact on productivity levels. High debt levels ultimately have to be financed by increasing taxation or reducing spending. Or, if governments have the power to do so, they can use monetary policy to induce inflation as a way to reduce their debt burden. Expectations in these directions, triggered by high government debt burdens or excessive deficit financing of budgets, can distort investment decisions and thus lower the potential for higher productivity. The impact of fiscal policy on the business cycle could also have an impact on productivity: more cyclicalities can increase the periods of time in which companies with financing constraints are unable to finance otherwise-profitable long-term investments. Overall, however, the empirical literature suggests that the impact of fiscal policy on long-term productivity differences is weak, especially after controlling for the quality of political institutions.²¹

Monetary policy, especially the level of the money supply, is also normally treated primarily in the context of short-term fluctuations in economic activity. But monetary policy can also have longer-term effects: high and volatile inflation can, for example, render price signals hard to interpret and thus distort decisions away from investments that lead to higher productivity. While the empirical literature tends to support this view for very high rates of inflation, there is less conclusive evidence of the impact of moderate levels of inflation on long-term productivity growth.²² Nevertheless, there is a broad policy consensus on the need for monetary policy to support low inflation.²³

Social infrastructure and political institutions (SIPI) have become the focus of much academic analysis and policy attention in the last two decades.²⁴ New datasets have been created to compare policies and institutions across countries and test systematically for their impact on prosperity levels.²⁵ Given this literature, the policy debate shifted toward an “augmented” Washington consensus, combining solid macroeconomic policy with a stronger focus on social infrastructure and political institutions.²⁶

The new GCI captures three dimensions of SIPI, each of which has been the focus of different types of research: basic human capacity, political institutions, and rule of law. Countries tend to achieve similar levels of performance along these different dimensions, but deviations exist and can sometimes continue for extended periods of time.

Basic human capacity, such as basic education, health care, and a clean environment, is necessary to enable individuals to effectively engage in economic activity.²⁷ The presence of malaria or an HIV/AIDS epidemic, for example, means that large segments of society must concentrate on sustaining their basic health, which lowers productivity.²⁸ If large parts of the population

have no basic reading and writing skills, their ability to achieve higher productivity is also severely limited.

The nature of political institutions is important because it affects the content and the predictability of the rules and regulations that set the overall context of the economy. The empirical literature finds no simple relationship between specific political systems and economic outcomes,²⁹ and whether democratic reforms are more sustainable before or after economic reforms is equally contested.³⁰ Generally accepted is that all (or almost all) economies with high levels of prosperity are democracies.

The rule of law, especially the existence of property rights and the ability to protect legal rights against private and public interests, has an important influence on the incentives to engage in economic activity, especially transactions with others.³¹ If property rights are weak, assets cannot be brought to their best economic use and productivity suffers.³² But even when property rights do exist, corruption can reduce their economic value by making it harder to establish them in a court of law or allowing harmful economic policies.³³ The rule of law can also be threatened by military conflicts or high levels of crime. War, especially civil war, substitutes the use of power for the market.³⁴ If the population is engaged in fighting or must devote resources to protecting their livelihood, the opportunities for higher productivity are naturally limited. Crime raises the costs of doing business and reduces the incentives to make investments that enable higher levels of productivity. Empirical support of the relationship of security and productivity, however, is limited.³⁵

The empirical growth literature has found SIPI to have a strong impact on prosperity levels. In fact, much research identifies SIPI as the most important (if not the only) factor that matters for long-term differences in prosperity.³⁶ But differentiating the impact of institutions from other factors econometrically, especially geographic location, is complex because of high levels of correlation. There are still many skeptics about the interpretation of findings.³⁷

Microeconomic competitiveness

Microeconomic factors operate directly on firms in affecting productivity. These factors are influenced by multiple discrete stakeholders. Government is an important player, but many different agencies and administrative units at several levels of geography with differing degrees of autonomy, not just the central government, are involved in decision making and policy action. Companies, academic institutions, and many business associations and other mixed groups organized to facilitate collaborative action, are essential in defining the microeconomic environment in which business takes place.

Microeconomic factors are so numerous and multifaceted that simultaneous progress across all of them is

rarely feasible. Each country will have its own unique strengths and weaknesses. In any given country at a particular point in time, a subset of microeconomic conditions will represent the most pressing barriers to reaching higher levels of productivity.³⁸ At specific transitions, countries need to make many simultaneous changes across a broad number of policy areas to enter a new stage of economic development. Unless these evolving constraints to productivity are addressed, productivity growth will not occur. This logic reveals the mistake of competitiveness policies based on political ideology—for example, the “right” always arguing for lower taxes and more privatization, the “left” always arguing for more investments in skills and infrastructure. It also calls into question any theory that suggests generic answers to economic development rather than those tailored heavily by country. Because the constraints change over time, governments need to review and update priorities in intervals that might not coincide with the political cycle.

The New GCI framework distinguishes two broad areas of microeconomic competitiveness (Figure 4): the sophistication of company operations and the quality of the business environment. A third category—the state of cluster development (agglomeration economics)—is conceptually distinct, but data limitations preclude independent measurement. Cluster variables are included as part of the business environment. The microeconomic components of the New GCI builds on the foundations laid in the BCI of recent years.

Company sophistication, measured by company strategies and operational practices, is an area that has been largely neglected in the traditional literature on economic growth. Yet the productivity of a country is ultimately set by the productivity of its companies. An economy cannot be competitive unless companies operating there are competitive, whether they are domestic firms or subsidiaries of foreign companies. The heterogeneity of firm productivity within countries has a significant impact on overall productivity differences across countries.³⁹

The productivity of companies depends in part on the sophistication with which companies compete. Productivity rises as a company improves the operational effectiveness of its activities and assimilates global best practices. Productivity also rises as companies achieve distinctive strategies, involving unique products and innovative means of production and service delivery. Conversely, competing using low factor input costs at low productivity methods does little to contribute to sustainable prosperity.

The productivity of companies is affected by corporate governance structures. The presence of large, highly diversified business groups, common in developing countries, can retard productivity because of lack of focus, monopoly power, and government favoritism. If business groups are instruments of market power or

Figure 4: Microeconomic competitiveness

preferential political access, they can generate private profitability but hinder public prosperity.

Differences in the sophistication of company operations and strategy across countries have received scant coverage in the traditional empirical growth analysis. Company factors have been essentially taken as endogenous once business environment and macroeconomic factors were accounted for. Many standard models assume that best practices will be quickly implemented by profit-maximizing companies. But more recent analyses indicate significant differences in operating practices and capabilities, even across countries at similar stages of overall economic development. Researchers, notably those from a management or industrial organization tradition, have started to compare aspects of company sophistication across countries.⁴⁰ Yet there are still few datasets with broad country coverage in this area.

Business environment quality has a strong impact on the productivity of companies. More productive company strategies and operating practices require more highly skilled people, more efficient administrative infrastructure, improved physical infrastructure, better suppliers, more advanced research institutions, and more intense competitive pressure, and so on. A higher-quality business environment, including the presence of well-developed clusters, significantly affect the capabilities that a company can access, the competitive choices it can make, and the productivity that it can generate using its internal assets.

Moving to more sophisticated ways of competing depends on parallel improvements in the microeconomic business environment. The business environment can be understood in terms of four interrelated dimensions: the quality of factor (input) conditions, the context of rules in which for firm strategy and rivalry take place, the quality of local demand conditions, and the presence of the related and supporting industries, most strongly

Figure 5: Business environment quality: The diamond

Source: Porter, 1990.

represented by deep clusters.⁴¹ Because of their graphical representation, the four areas have collectively become referred to as the “diamond” (see Figure 5).

Factor conditions have long been recognized as an important element affecting the productivity of companies. Physical infrastructure plays an important role in productivity, though there remains debate about the size of its effect.⁴² Globalization and the resulting increase in trade flows have increased the demands on transportation and communication infrastructure for countries at all levels of development.

Efficient access to capital is important for companies to make long-term investments that raise productivity levels. A large literature has developed that analyzes the impact of financial market development on prosperity.⁴³ Some researchers focus on the role of equity markets while others address the availability of credit. Although there is no clear evidence that either bank- or equity-based financial systems are preferable, more-developed financial markets are conducive to growth.

Both the quantity of and quality of training and higher education in an economy has been found to have a positive impact on prosperity levels.⁴⁴ There is also increasing evidence that globalization has increased skill

premia in both advanced and developing economies.⁴⁵ But at the same time, there is no simple relation between increased spending on education and productivity: some countries have seen the share of people reaching higher education levels rise considerably over the last few decades, while productivity rates remain low.⁴⁶

Science and technology infrastructure is important for productivity growth. In advanced economies, it becomes the source of new ideas that drive the frontier of knowledge outward. In countries further behind, it improves the absorptive capacity needed to draw on the knowledge others have already generated, thus enabling catch-up.⁴⁷ But innovative capacity is not only a matter of spending on research and development (R&D); microeconomic competitiveness has to be sufficiently high across many dimensions of business environment quality and company sophistication in order for R&D spending to generate more patenting and other innovative output.⁴⁸

The impact of red tape (or the bureaucratic burden) and the costs associated with administrative practices have recently gained more systematic attention in studies of competitiveness.⁴⁹ The time spent dealing with public agencies reduces the overall productivity of companies

by reducing the returns on investment and limiting entry by new companies, often a key driver of productivity growth.

The context of rules and incentives that govern firm strategy and rivalry is an important influence on how companies draw on the factor conditions that they face. High levels of competition on local markets prove to be especially crucial for high performance.⁵⁰ Competition drives the entry of new firms, the exit of underperforming firms, and levels of performance differences across existing firms. Because competition is so central, the impact of government—through competition laws, tax incentives and subsidies, and the conditions governing state-owned or -related companies—is essential to productivity. The ownership structure of companies (private or state-owned; conglomerate) is another factor that is important for the type of competitive interaction.⁵¹ Broader measures of the freedom to engage in economic activity are consistent with this view, but tend to mix a large number of different policy dimensions.⁵²

A key aspect of context for strategy and rivalry is a country's openness to foreign trade and investment. Openness enables countries to exploit their comparative advantages, a direct boost to economy-wide productivity. It enables access to more advanced ideas and technology from abroad, and exposes local companies to higher levels of competitive pressure. The empirical literature on the impact of openness on long-term differences in productivity and growth, however, provides mixed results. A number of researchers have found a relationship between openness and prosperity growth,⁵³ or verified the role of trade with advanced economies, as a means to tap into the knowledge stock.⁵⁴ Other studies are equivocal and debate the specific data and econometric approach used.⁵⁵ Some suggest that it might be the interplay among openness and other factors, such as strong institutions, that creates the positive effects,⁵⁶ while others maintain that trade has an independent positive effect.⁵⁷

Demand conditions have also received less consideration in the economics literature. Consumer protection and environmental regulation especially are normally seen as costly from the firm perspective; if more environmentally friendly products would fetch higher prices or lead to lower production costs, companies are assumed to have produced them without the need for regulation. The business literature has for some time argued that this is a simplistic view: with large amounts of uncertainty about future technologies, consumer needs, and regulations, stringent regulation that anticipates future changes in other markets can lead companies to make early investments in profitable technologies. And it is not unusual that these new technologies provide direct productivity benefits that companies had otherwise neglected.⁵⁸ In the management literature, there is also an increasing focus on the importance of

demanding lead customers as partners in the innovation process.

Clusters provide an intermediate unit of productivity drivers between the general business environment quality and firm level sophistication. Clusters are geographic agglomerations of companies, suppliers, service providers, and associated institutions in a particular field, linked by externalities and complementarities of various types.⁵⁹ Clusters, such as consumer electronics in Japan or high-performance cars in Germany, are often concentrated in a particular region within a larger nation, and sometimes in a single town. Clusters are a natural manifestation of the role of specialized knowledge, skills, infrastructure, and supporting industries in enhancing productivity.

Clusters play an increasing role in a global economy where the most competitive firms can serve wider markets unprotected by national borders. As competition has become more global, companies have more freedom to choose the location of their activities based on economic efficiency, not just market access.⁶⁰ Perhaps paradoxically, this has increased the importance of clusters as their productivity advantages become more important. National economies tend to specialize in a subset of clusters, in which they develop a particularly favorable business environment. Such clusters often account for a disproportionate share of a nation's traded output. Conversely, lower levels of regional specialization tend to be associated with lower levels of prosperity.⁶¹

The nature and depth of clusters varies with the state of development of the economy. In developing or emerging economies, clusters are less developed and firms perform relatively less advanced activities in the cluster.⁶² Clusters normally lack many supporting industries and institutions. Firms compete primarily based on cheap labor or local natural resources, and depend heavily on imported components, machinery, and technology. Specialized local infrastructure and institutions, such as educational programs and industry associations, are absent or inefficient. In more advanced economies, clusters usually deepen to include suppliers of specialized inputs, components, machinery, and services; specialized infrastructure emerges from public and private investment; and institutions arise that provide specialized training, education, information, research, and technical support.

The role of the business environment in competitiveness has been addressed by an increasing number of empirical assessments over the last two decades. For example, the World Bank's Investment Climate Survey covers about 50 countries.⁶³ Other assessments cover regulations affecting business.⁶⁴ For smaller groups of industrial countries, the OECD has generated rich assessments of the business environment, from investments in R&D to product market regulation.⁶⁵ Statistical studies on clusters across regions and countries are emerging.⁶⁶

The limited available data on clusters do not allow us to separate the role of clusters from the more general business environment that affects the economy more broadly. However, we included available cluster measures as parts of the national business environment in the New GCI.

Stages of economic development

Successful economic development is a process of successive upgrading, in which a nation's business environment evolves to support and encourage increasingly sophisticated and productive ways of competing by firms (including subsidiaries of multinational corporations) located there. Nations at different levels of development face distinctly different competitiveness challenges, where the relative importance of different dimensions of microeconomic and macroeconomic competitiveness for sustainable prosperity is changing.

As nations develop, modes of competing and nature of competitive advantages move through several characteristic stages, though rates of progress and the specific development path will vary by country.⁶⁷ In the factor-driven stage, basic factor conditions such as low-cost labor and unprocessed natural resources represent the dominant basis of competitive advantage and sources of exports. Firms produce commodities or relatively simple products or components of products designed in other, more-advanced countries. Technology is assimilated through imports, supply agreements, foreign direct investment, and imitation. In this stage, companies compete on price and normally lack direct access to foreign consumers. Companies have limited roles in the value chain, focusing on assembly, labor-intensive manufacturing, and resource extraction. Factor-driven economies are highly sensitive to world economic cycles, commodity prices, and exchange rate fluctuations, mitigated only in very large countries such as China, which have a large internal market to attract investment independent of export potential.

In the investment-driven stage, a country's advantage comes from producing more advanced products and services highly efficiently. Heavy investment in efficient infrastructure, business-friendly government administration, strong investment incentives, improving skills, and better access to investment capital allow major improvements in productivity. The products and services produced are not globally differentiated, however, with technology and designs still largely coming from abroad. Technology is accessed through licensing, joint ventures, foreign direct investment, and imitation. Nations at this stage normally assimilate foreign technology but also begin to develop the capacity to improve technology themselves. Companies extend capabilities more widely in the value chain, and serve a wider mix of original equipment manufacturer (OEM) customers and end users. An investment-driven economy is concentrated on manufactured goods and outsourced service exports. It

remains susceptible to financial crises and external, sector-specific demand shocks, but competitiveness is more stable than in countries depending on commodity cycles and factor prices.

In the innovation-driven stage, the ability to produce innovative products and services at the global technology frontier using the most advanced methods becomes the dominant source of competitive advantage. The national business environment is characterized by strengths in all parts of the diamond, including sophisticated demand conditions and deep supporting industries. Competitiveness emerges in an array of clusters where knowledge, supporting industries, and specialized inputs are present. Institutions and incentives that enable innovation are well developed. Companies compete with unique strategies that are often global in scope. An innovation-driven economy is characterized by distinctive producers and a high share of services in the economy and is quite resilient to external shocks.

The sequential process of building interdependent microeconomic capabilities, improving incentives, evolving company strategies, and increasing rivalry creates important pitfalls in economic policy. The influence of one part of the business environment depends on the state of another. Lack of improvement in any important area can lead to a plateau in productivity growth and stalled development. Worse yet, key weaknesses in the diamond can undermine the entire economic reform process. For example, when well-trained college graduates cannot find appropriate jobs because companies are still competing based on cheap labor, a backlash against business is created. This analysis also begins to reveal why countries find the transition to a new stage of development so difficult. Such inflection points require wholesale transformation of many interdependent aspects of competition, not just marginal improvements in individual policy areas.

We incorporate stages of development into the New GCI to capture the fact that different determinants of competitiveness will be the binding constraints of countries' progress.

Ranking competitiveness

The academic literature and previous indexes provide a foundation for the selection of indicators and guidance in developing an overall architecture for organizing them in an integrated framework. We include microeconomic factors because of our access to unique data.

Whether or not individual factors are included in the New GCI, and how strongly they are weighted in measuring competitiveness, is determined by the data. Our approach thus minimizes the role of conceptual priors and subjective assessments.

The robustness of the results of the New GCI to modifications in individual indicators and estimation procedures has been extensively tested. The aim is to

ensure that the New GCI is capturing basic insights about country performance, rather than artifacts of a single econometric approach or subjective weighting scheme. The findings are presented in a way that highlights the implications for decision makers in governments and companies.

Data

The model draws on a wide range of data from the Executive Opinion Survey (more on the Survey in Chapter 2.1 in this *Report*) as well as extensive hard data and survey indicators from other internationally recognized data sources. The use of survey data in economic analysis is growing despite skepticism among some researchers. Our survey data are timely and offer many unique measures not otherwise available. The survey data used here are based on the *informed judgments of the actual participants* in the economies of the countries examined. These survey responses are important in their own right, because they reflect the attitudes of the decision makers that ultimately determine economic activity.

The data used for the development of the New GCI model cover 130 countries for up to 7 years (2001–07), the longest period possible given the data sources. The academic literature often examines longer time periods, but covers a far narrower set of indicators. In subsequent years, the stability of the model over longer time periods will be examined.

Dependent variable

The New GCI model is derived from statistical estimations explaining GDP per capita adjusted for purchasing power, the best overall measure of prosperity.⁶⁸ Statistical testing using a clearly defined dependent variable is the only way to allow a rigorous development of the model, in contrast to arbitrary specification of indicators, data groupings, and weights that characterize most other index efforts.

GDP per capita is the broadest measure of national productivity and is strongly linked over time to a nation's standard of living. It is the best single, summary measure of competitiveness performance available across all countries.⁶⁹

More direct measures of productivity, such as GDP per labor force, are desirable. However, they are not feasible given unreliable labor force data in many low income countries. Other measures, such as GDP per employee or GDP per hour worked, are useful indicators of productivity but fail to capture the ability of an economy to mobilize the overall workforce. Total Factor Productivity suffers from significant data limitations that compromise its ability to accurately measure capital utilization and skill accumulation across countries in a consistent manner.

Endowments

GDP per capita will reflect a country's particular endowments (we term this "inherited prosperity"), not only its productivity in using these endowments ("created prosperity"). Controlling for endowments allows the New GCI to distinguish between prosperity and productivity, rather than co-mingling productivity with resource abundance.

Natural endowments can have an indirect impact on competitiveness if they encourage specific policy choices that benefit or harm macroeconomic or microeconomic competitiveness. The New GCI model makes it possible to distinguish the direct (positive) prosperity effect of natural endowments from their indirect (potentially negative) effect on competitiveness.

The New GCI controls for natural resources endowments by using per capita unprocessed natural resource exports. The revenues from natural resource exports constitute a direct source of prosperity. Endowments in terms of geographical location are captured by the percentage of land area within 100 kilometers of ice-free coast or navigable rivers as a control for location. Direct access to maritime transport allows countries to fully engage in global trade without the need for a transit country. The academic literature also examines the impact of being close to the equator as a locational influence, and as a proxy for exposure to tropical diseases. We recognize this potential, but measure instead the effectiveness of the policy responses to them (e.g., health system effectiveness) elsewhere in the model.

The size of a country can also be seen as an endowment. Larger countries might more easily attract investment just because of their local market potential, even if they are not more competitive. Size might also foster economies of scale in areas such as R&D. We include population size as a control, instead of size of GDP. GDP size is the result of competitiveness, not an independent measure.

Competitiveness indicators

Many things matter for competitiveness, and consequently a wide range of data is incorporated into the model. Because the model is designed to guide specific action priorities for countries, multiple indicators are used even if they are highly correlated in the overall sample. Although indicators may be correlated overall, individual countries often lead or lag in particular policies that are salient for designing development priorities. This inclusion of many variables differentiates the GCI model from many models in the academic literature that aim to identify the minimum number of indicators that explain prosperity.

The selection of indicators is pragmatic. Candidate indicators are identified that capture aspects suggested by theory. The New GCI model requires the availability of recurring annual data for a very large number of

countries, in contrast to a one-time analysis covering a limited number of countries.

Each indicator is then tested for a statistically significant relationship to GDP per capita adjusted by purchasing power (log), controlling for endowments (see Table 1).⁷⁰ Some of the indicators that are most strongly correlated with GDP per capita include mobile phone and fixed line penetration, regulatory quality, the quality of electricity supply, and per capita patenting in the United States. Such indicators capture basic or advanced dimensions of the microeconomic business environment. Conversely, indicators of MP exhibit the weakest correlations with prosperity.

In selecting indicators, two areas of policy—taxation and labor market regulations—deserve special discussion because they have no simple linear relationship to prosperity. Taxation levels tend to be higher in countries with stronger institutions and that invest more heavily in public infrastructure and education. This endogenous positive effect of effective spending on competitiveness is econometrically hard to distinguish from the direct negative incentive effect of higher taxation. In the model, we include direct measures of the incentive effect and the administrative burden associated with taxation that are less affected by these problems, rather than the overall level of taxes in GDP.

The challenge with measuring labor market conditions is that labor markets tend to be more regulated in countries with highly developed institutions. Thus there is no simple relationship between the level of regulation and the actual level of labor market flexibility and work practices. Again, we use a direct measure of labor market flexibility, rather than broader institutional characteristics of the labor market.

Grouping indicators

Because many things matter, countries often get bogged down in their efforts to improve competitiveness by tackling too many individual issues in parallel. The challenge is to identify those areas where action can unlock higher productivity at a given point in time. Priorities are country-specific and change over time.

The New GCI aims to offer a framework to inform overall policy while establishing priorities at the specific policy level. The model groups the numerous influences on competitiveness into categories that capture different mechanisms of influence. These groupings are organized hierarchically so that each part of the model sums to the whole (Figure 6). Other indexes tend to treat numerous variables independently, without an understanding of the how they relate to each other.

The **New Global Competitiveness Index (NGCI)** is the overall ranking of country competitiveness, incorporating all factors. The NGCI score is designed to be the best overall predictor of productivity across all countries.

At the second level, rankings are presented on **macroeconomic competitiveness** and **microeconomic competitiveness**. Macroeconomic competitiveness indicators create opportunities for productivity but are not sufficient for high productivity to emerge. Microeconomic competitiveness indicators have a direct impact on company productivity.

At the third level, rankings are presented on four subindexes of macroeconomic and microeconomic competitiveness. In the macroeconomic area, indicators of **macroeconomic policy (MP)** capture economic policies that have a strong impact on short-term fluctuations of economic activity and can have long-term consequences for productivity. **Social infrastructure and political institutions (SIPI)** collects indicators of more general human conditions and institutions. In the microeconomic area, subindexes cover the **sophistication of company operations and strategy (COS)** and the overall **quality of the national business environment (NBE)**.

At the fourth level, rankings are provided for subcategories of the third level. In the MP category, indicators are grouped by **fiscal policy** and **monetary policy**. In the SIPI category, indicators are grouped into **basic human capacity** (basic health and education), **political institutions** (decision making and efficiency of the executive), and the **rule of law** (corruption and efficiency of the legal process). In the NBE category, indicators distinguish the four elements of the diamond framework⁷¹—that is, **factor conditions**, **context for strategy and rivalry**, **demand conditions**, and **related and supporting industries/clusters**.

At the fifth level, some areas of microeconomic competitiveness are further differentiated into narrower subcategories to better target policy responses. Under factor conditions, indicators are grouped by **logistical infrastructure**, **communications infrastructure**, **administrative infrastructure**, **capital market infrastructure**, and **innovation infrastructure**. Under COS, indicators are grouped by **strategy and operational effectiveness**, **organizational practices**, and **internationalization of firms**.

In most cases, the allocation of individual indicators to categories is clear (see Table 1). For a limited number of indicators, however, the allocation of a particular measure requires a judgment based on the nature of the indicator's primary effect on competitiveness together with its statistical properties.⁷² For *education*, primary education is allocated to SIPI (macroeconomic competitiveness) while the quantity and quality of advanced and specialized levels of education are allocated to the NBE (microeconomic competitiveness). We view primary education as a broad indicator of the ability of individuals to participate in society, and a foundation for further education and skill development. For *trade barriers*, all indicators, including the average tariff rate on imports, are allocated to NBE. Trade barriers are primarily an

Figure 6: Six levels of measurement

indicator of the competitive pressure from foreign rivals, even though they are also relevant as a measure of general openness of an economy. The direct relationship of tariff rates to productivity of firms is akin to other indicators in the NBE, in contrast to the more general MP indicators. For *taxation*, measures of taxation effectiveness are also allocated to the NBE. Although it has a relation to fiscal policy (MP), effective taxation mechanisms are best seen as an indicator of general administrative infrastructure.

Stages of development

To reach higher levels of economic development, countries experience systematic changes in the relative importance of different aspects of competitiveness for prosperity. Understanding these broad patterns is important in understanding the challenges faced by policymakers in a given country.

The New GCI model uses SIPI as a proxy for overall stage of economic development. Countries are ranked by their average SIPI score (using 2001–07 data) as well as by their score for each of the three SIPI components (human capacity, rule of law, and political stabil-

ity). The countries falling into the top tercile for each of the SIPI components as well as the aggregate SIPI measure are assigned to the high stage of development group. Countries that fall into the top tercile for the overall SIPI index or its human capacity component (a group of indicators that is particularly robust to short-term policy changes) but rank lower on other SIPI components are assigned to the middle group. The remaining countries are assigned to the low stage of development group.⁷³

A country's SIPI score provides a good indication of the opportunities of companies to compete at more sophisticated levels. More developed social infrastructure and political institutions make it more likely that companies can compete on efficiency or even on innovation. Weaknesses in SIPI, in contrast, often relegate companies to compete on resources or cheap labor.

Other indicators of development stage are possible, but testing reveals that using SIPI is the most revealing statistically. A number of studies have used GDP per capita to identify country groups, but we reject this because defining subgroups using the dependent variable introduces a serious estimation bias.

Table 2: Countries by stage of development

HIGH		MIDDLE		LOW	
Australia	Spain	Bahrain	Albania	Georgia	Nigeria
Austria	Sweden	Brunei Darussalam	Algeria	Ghana	Pakistan
Barbados	Switzerland	Chile	Argentina	Guatemala	Panama
Belgium	Taiwan, China	Costa Rica	Armenia	Guyana	Paraguay
Canada	Tunisia	Czech Republic	Azerbaijan	Honduras	Peru
Cyprus	United Kingdom	Hungary	Bangladesh	India	Philippines
Denmark	United States	Jordan	Benin	Indonesia	Poland
Estonia		Korea, Rep.	Bolivia	Jamaica	Romania
Finland		Kuwait	Bosnia and Herzegovina	Kazakhstan	Russian Federation
France		Latvia	Botswana	Kenya	Senegal
Germany		Malaysia	Brazil	Kyrgyz Republic	Serbia
Greece		Mauritius	Bulgaria	Lesotho	South Africa

Iceland		Oman	Burundi	Lithuania	Suriname
Ireland		Puerto Rico	Cambodia	Macedonia, FYR	Syrian Arab Republic
Israel		Saudi Arabia	Cameroon	Madagascar	Tajikistan
Italy		Slovak Republic	Chad	Malawi	Tanzania
Japan		United Arab Emirates	China	Mali	Thailand
Luxembourg		Uruguay	Colombia	Mauritania	Timor-Leste
Malta			Côte d'Ivoire	Mexico	Trinidad and Tobago
Netherlands			Croatia	Moldova	Turkey
New Zealand			Dominican Republic	Mongolia	Uganda
Norway			Ecuador	Morocco	Ukraine
Portugal			Egypt	Mozambique	Venezuela
Qatar			El Salvador	Namibia	Vietnam
Singapore			Ethiopia	Nepal	Zambia
Slovenia			Gambia, The	Nicaragua	Zimbabwe

Estimating the New GCI model

The appropriate weighting of individual indicators in determining overall competitiveness is a crucial part of any index model.⁷⁴ The New GCI model calculates weights based on a regression of the pooled dataset on country GDP per capita. The stability of the model is tested by reallocating individual indicators and assessing the stability of the weights and the overall score. Other similar indexes have almost invariably set weights based on subjective priors based on the literature. Yet differences in opinion in the academic literature leave the door open for different choices that can compromise the resulting rankings.

The New GCI is generated in a two-stage process. First, the weights for aggregating individual indicator scores to an overall country score are obtained using panel data for over 130 countries and up to 7 years (2001–07). The weights obtained from estimating the model are going to be kept constant over time. Additional years of data will be used to check the stability of the model over time. Second, the index score for a particular country in a given year is calculated by summing its weighted indicator values.

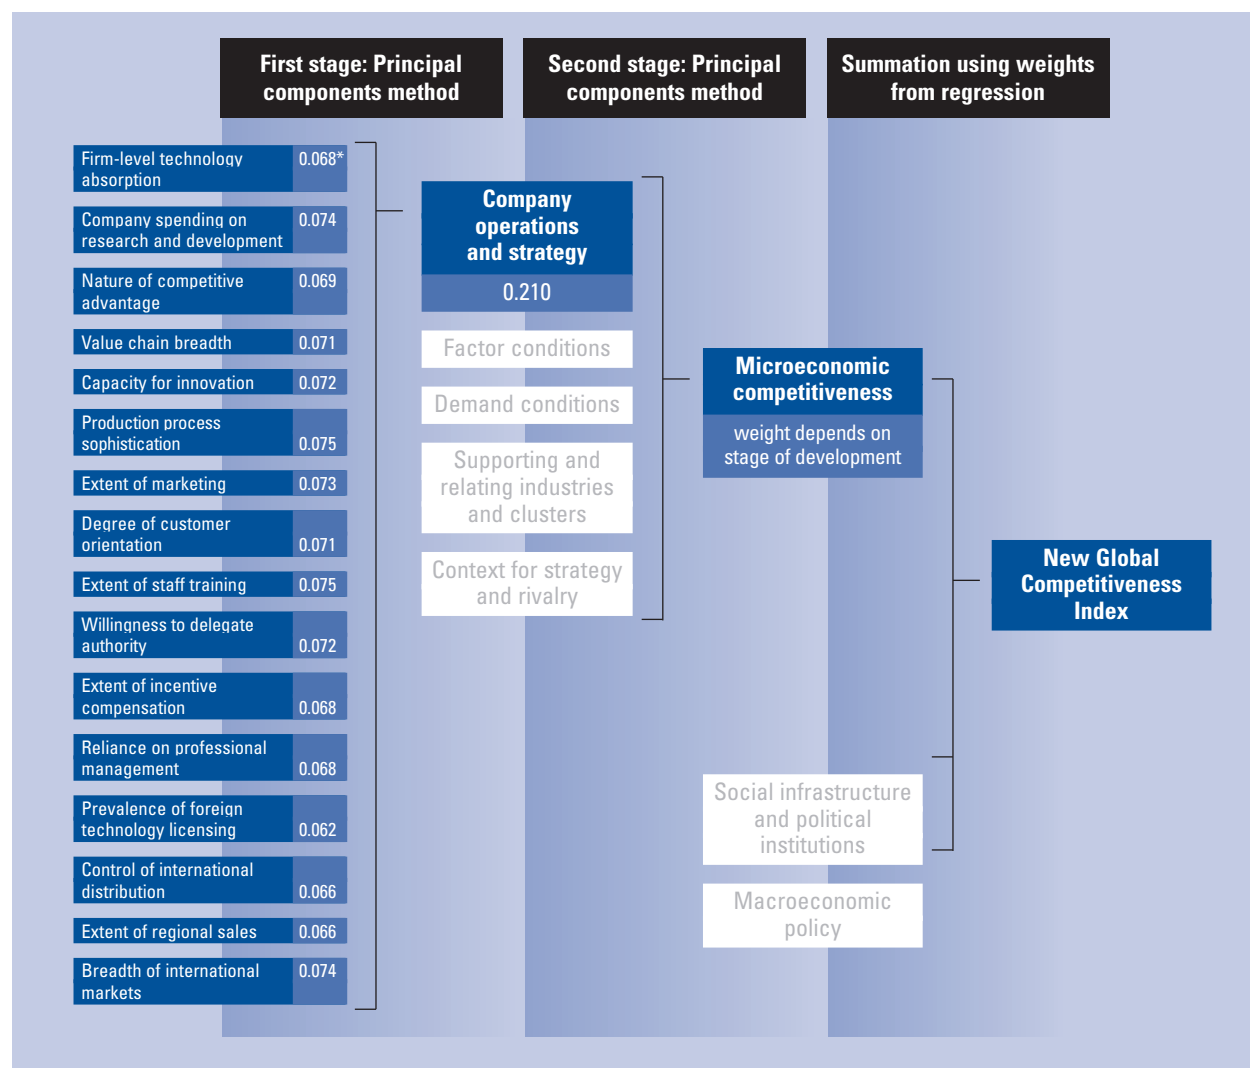

The New GCI model uses principal component analysis (PCA) to aggregate individual indicators (or categories of indicators). The premise of the PCA method is that within a “conceptual category,” indicators

are highly correlated and related to the underlying phenomenon that is being measured. Within the area of microeconomic competitiveness, the degree of correlation between indicators is very high. The New GCI model thus applies a two-step PCA procedure. First, a separate aggregation is computed for COS and for each of the four components of the NBE. Second, these five components are aggregated into an overall score for microeconomic competitiveness.⁷⁵ Figure 7 provides a sample calculation, showing the specific scores calculated for the indicators in company operations and strategy using the current specification of the new GCI model.

Within the area of macroeconomic competitiveness, the degree of correlation between indicators is relatively high within SIPI and MP but not across them, because they capture distinct concepts. The new GCI model thus uses PCA to calculate a score for SIPI and a score for MP, but does not use PCA for further aggregation.

The second step in computing the New GCI is to measure the contribution to country competitiveness of MICRO, SIPI, and MP. We specify a comprehensive regression that uses GDP per capita purchasing power adjusted (log) as the dependent variable, with scores for MICRO, SIPI, and MP for each country and year as the main explanatory variables, controlling for with endowments and year effects. The model allows the coefficients to vary by country stages of development by interacting

Figure 7: Calculation of the New GCI: Sample results

* Numbers shown are weights.

the explanatory variables with a dummy indicating the country's stage (see the section on "Stage of development").⁷⁶ The core econometric specification is as follows:

$$\begin{aligned} \log \text{GDPpc}_{c,t} = & \alpha_0 + \delta \text{HIGH-SIPI}_c + \beta_{\text{MICRO}} \text{MICRO}_{c,t-1} \\ & + \delta_{\text{MICRO}} \text{HIGH-SIPI}_c \times \text{MICRO}_{c,t-1} \\ & + \beta_{\text{SIPI}} \text{SIPI}_{c,t-1} + \delta_{\text{SIPI}} \text{HIGH-SIPI}_c \times \text{SIPI}_{c,t-1} \\ & + \beta_{\text{MP}} \text{MP}_{c,t-1} + \delta_{\text{MP}} \text{HIGH-SIPI}_c \times \text{MP}_{c,t-1} \\ & + \alpha_{\text{END}} \text{ENDOWMENTS}_{c,t-1} \\ & + \delta_{\text{END}} \text{HIGH-SIPI}_c \times \text{ENDOWMENTS} \\ & + \alpha_t \text{year}_t + \delta_t \text{HIGH-SIPI}_c \times \text{year}_t + \varepsilon_{c,t} \end{aligned}$$

The estimated coefficients are then scaled into weights for microeconomic competitiveness, SIPI, and MP that vary for low-, middle-, and high-SIPI countries. Table 3 reports the weights derived with the current specification of the model.⁷⁷

Table 3: Subindex weights by countries' stage of development

Subindex	Stage of development			Linear model (all economies)
	Low (%)	High (%)	Medium (%)	
MICRO	0.21	0.48	0.35	0.31
SIPI	0.49	0.36	0.42	0.41
MP	0.30	0.16	0.23	0.28
	1.00	1.00	1.00	1.00

The New GCI model explains 85 percent of the variation of prosperity across countries, a remarkable result in such a dataset covering a large number of countries at highly varying levels of economic development. It shows, for the first time, that both microeconomic and macroeconomic competitiveness have an independent effect on productivity, even when controlling for the other. Many previous analyses have looked at individual measures without putting them in a broader framework.

The growth literature, in particular, has tended to argue that macroeconomic competitiveness, especially institutional factors (SIPI in the New GCI model), dominate and predict differences not only in prosperity but also in microeconomic competitiveness. Instead, the New GCI results support an independent role for each of them.

The weights of the broad drivers of competitiveness change systematically across stages of development. At lower levels of development, SIPI matter most, followed by MP, followed by microeconomic competitiveness. At higher levels of development, microeconomic competitiveness dominates, followed by SIPI and then MP.

Calculating and interpreting the Index

For each country, the calibrated weights are applied to the set of indicator values to generate an overall Index score,⁷⁸ as well as scores for each broad category, subcategory, and narrow subcategory of competitiveness determinants.

The overall New GCI ranking provides a powerful summary of each country's competitiveness relative to peers. The patterns of strengths and weaknesses across the different categories of competitiveness provide robust information with which to set country-specific action priorities.

Changes in the New GCI ranking and indicator scores provide an important insight into a country's competitiveness trajectory over time. The relationship among the New GCI score, endowment controls, and actual GDP per capita level bear on the sustainability of a country's prosperity. Prosperity levels that are explained neither by competitiveness nor endowments are a cause for concern. Such levels may well be the consequence of short-term growth spurts with, for example, high consumption or investment in areas such as real estate that are not sustainable over time. Prosperity levels that are largely driven by endowments, especially natural resource deposits, suggest specific steps to overcome the negative economic and policy risks associated with inherited wealth in hindering future competitiveness.

The relationship of the New GCI score to other economic performance indicators, such as wages, provides further insights. Competitiveness depends not on costs, but on productivity. The prevailing wages relative to competitiveness will make a country more or less attractive as an investment location. Low wages can be a sign of low competitiveness, instead of a competitive advantage. High wages, if they are justified by high productivity, mean that a country represents an excellent value as a business location. Some countries have wages that are significantly above or below the expected wage level given the country's New GCI value. This can occur for a variety of reasons, ranging from strong unions and inflexible labor markets to recent competitiveness improvements that run ahead of wage increases.

Comparing the New GCI with the current Index

The New GCI model builds on the foundations in previous years' GCI as well as the BCI.⁷⁹ The overall rankings derived in our preliminary application of the New GCI model are broadly similar to the current GCI, underlining the continuity of the methodology. However, differences exist and are revealing in many ways.

The largest single source of rank differences between the New GCI and the current Index is the higher weighting in the New GCI associated with macroeconomic competitiveness. This greater importance is derived from the actual data. For the most advanced economies, macroeconomic competitiveness (SIPI and MP) together account for about 45 percent of the overall New GCI score, compared with 23 percent in the current GCI. For developing economies, the change is even more pronounced, with macroeconomic competitiveness accounting for 83 percent vs. 38 percent in the current model. Macroeconomic factors, especially institutional strength, have been identified in the literature as an important element of long-term prosperity differences and this importance is revealed in our regressions.

Another important difference is the role of market size. Market size, which accounted for between 6 and 8 percent of the overall score in the current GCI, is now included as a control rather than as a dimension of competitiveness. Market size can have an impact on productivity and lead to FDI inflows above the level otherwise expected, especially when the market is very large. But, as previously discussed, the literature on this point has not come to conclusive results. China, Brazil, and India will be ranked lower on competitiveness because they do not get a bonus for country size independent from their fundamental conditions.

The New GCI model also utilizes an improved set of indicators in the MP area compared to the current macroeconomic pillar. The most important change is that the savings rate is no longer included in the model, since the growing globalization of financial markets makes it increasingly less realistic that the local savings rate determines the amount of capital available.⁸⁰ These changes have a limited impact on the overall rankings. The United States will rank higher in the new MP area than in the current macroeconomic pillar, for example, largely because it is no longer penalized for its low savings rate.

Finally, the New GCI weights the aspects of microeconomic competitiveness based on the data. For example, the current GCI model gave about 60 percent of the overall business environment weight to measures of factor conditions, largely because there were more indicators available in this area. The New GCI, with no priors about the relative weights, has a lower influence of factor conditions. The impact of the weighting differences on the overall ranking is modest.

Conclusion

The *Global Competitiveness Report* has long been an important tool for measuring competitiveness across countries. Our decision to develop a new approach for calculating the Global Competitiveness Index reflects our desire for excellence. The ambition to continuously integrate new thinking must be balanced with the need for a framework that has the stability needed for consistent rankings and to earn the trust of policymakers and the wider public. Hence we will introduce the New GCI in 2009, after almost two years of testing and refinement. As we finalize the New GCI, we will seek input from policymakers, business leaders, and scholars to ensure that the New GCI not only meets the highest standards of academic research but also serves the needs of practitioners.

The New GCI promises to reveal important new insights into the causes of competitiveness. It will disentangle the relationships between prosperity, endowments, and competitiveness, giving countries a way to separate the impact of externally given conditions from their own policy choices. It will help countries to identify whether macroeconomic or microeconomic competitiveness, each of which requires a very different policy process, should be at the forefront of policy action.⁸¹ And it will give individual countries better insights into their relative strengths and weaknesses, their position compared with that of their peers, and their trajectory over time. All of these are critical elements for prioritizing policy actions in a way that targets the unique challenges any country faces at a given point in time.

Notes

- 1 Ciccone and Jarocinski 2008.
- 2 Unit labor costs (wages relative to labor productivity), a measure often used by international financial institutions, is a misleading indicator of competitiveness. It is helpful to understand the capacity for exports, much more so than pure wage costs per se. But it does not have an unambiguous relationship to prosperity and is often used to motivate policies that manage wages rather than raise productivity.

- 67 Porter 1990.
- 68 We used this approach already in developing the BCI.
- 69 In the case of Ireland, we used GNP instead of GDP because of the size of dividend outflows to foreign investors. Ireland's GDP is about 20 percent higher than its GNP.
- 70 All results reported here and later in the chapter are for the current definition of indicators and the current specification of the model. While these specific results might change with further refinements of the model, we want to share the current results to enable a meaningful debate about our approach.
- 71 Porter 1990.
- 72 We have tested these choices statistically and found the overall ranking is highly stable to recategorization of specific indicators.
- 73 Exceptions of countries that come close to these cut-offs and are still assigned to the middle group are Latvia, Mauritius, and Saudi Arabia. In addition, Italy and Greece are assigned to the high group because they are EU members even though they fail the SIPI test. Brunei is assigned to the middle group because of its focus on natural resources; it otherwise meets the high SIPI test.
- 74 Lall 2001.
- 75 In order to measure microeconomic competitiveness, we aggregate COS and the four components of the NBE using PCA. Using the factor analysis, each component gets roughly the same weight. Specifically, the microeconomic competitiveness of country c in year t is computed as follows:

$$\begin{aligned} \text{MICRO}_{ct} = & 0.21 \times \text{COS}_{ct} + 0.21 \times \text{NBE-Factor Conditions}_{ct} \\ & + 0.21 \times \text{NBE-Demand}_{ct} \\ & + 0.20 \times \text{NBE-Related Industries}_{ct} \\ & + 0.20 \times \text{NBE-Context}_{ct} \end{aligned}$$

- 76 While a model that takes into account country stages is our goal, a linear model that generates meaningful results is an important test for the stability of the approach. Thus we also estimate the following linear model to have a useful benchmark:

$$\begin{aligned} \log \text{GDPpc}_{c,t} = & \alpha_0 + \beta_{\text{MICRO}} \text{MICRO}_{c,t-1} + \beta_{\text{SIPI}} \text{SIPI}_{c,t-1} \\ & + \beta_{\text{MP}} \text{MP}_{c,t-1} + \alpha_{\text{END}} \text{ENDOWMENTS}_{c,t-1} \\ & + \alpha_1 \text{year}_t + \varepsilon_{c,t} \end{aligned}$$

- 77 For the regression, countries in the first tercile of SIPI ranks are assigned to the "high" group and all other countries to the "low" group. The dataset does not generate significant results if we divide countries into three groups. The regression generates coefficients for the "high" and "low" stage of development. For the calculation of the Index, we divide countries into three groups as discussed in the text. For the "high" and "low" group of countries, we use the coefficients derived in the regression. For the "medium" stage of development countries, we compute weights by averaging the estimated weights for the high-SIPI and low-SIPI countries.

- 78 The index for a particular country c in year t is calculated by summing its weighted microeconomic and macroeconomic components:

$$\text{GCI}_{c,t} = \omega_{\text{micro}}^S * \text{MICRO}_{c,t} + \omega_{\text{SIPI}}^S * \text{SIPI}_{c,t} + \omega_{\text{MP}}^S * \text{MP}_{c,t};$$

S=High, middle, or low stage of development

- 79 See Porter et al. 2007.
- 80 The new model also uses a different scaling approach for some of the other indicators. Instead of scaling linearly with some upper cut-off points, we use the log of the indicator.
- 81 Porter and Ketels (2008) analyze this for the case of Russia where centralization of power has benefited macroeconomic stabilization but made progress on microeconomic competitiveness elusive.

Country/Economy Profiles and Data Presentation

Executive Opinion Survey: Capturing the Voice of the Business Community

CIARA BROWNE, World Economic Forum

RICHARD BRYDEN, Institute for Strategy and Competitiveness,
Harvard Business School

MERCEDES DELGADO, Institute for Strategy and Competitiveness,
Harvard Business School, and Fox School of Business, Temple
University

THIERRY GEIGER, World Economic Forum

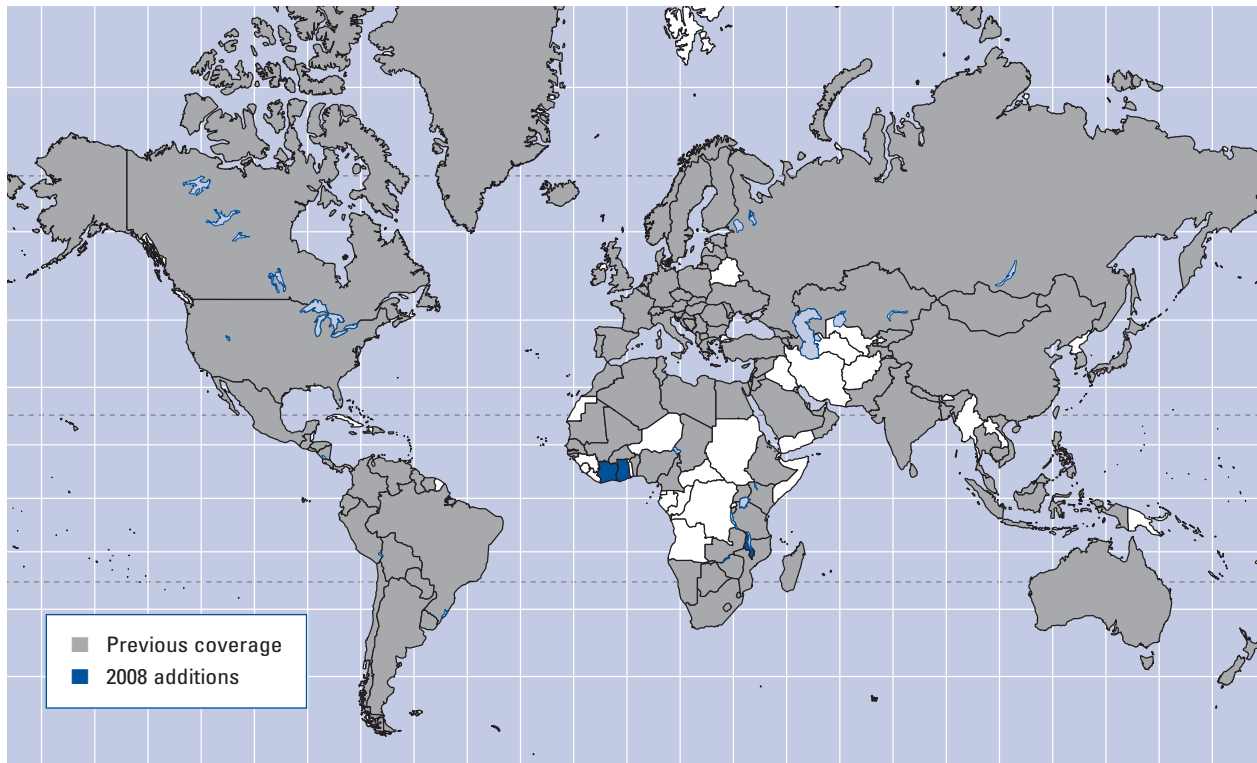

The main goal of *The Global Competitiveness Report* is to provide a picture of a nation's economic environment and its ability to achieve sustained levels of prosperity and growth. Capturing this information in an accurate way does not come without its challenges, given the breadth of issues that drive national competitiveness as well as the large number of national economies covered in the *Report* (many of which are from the developing world). The Executive Opinion Survey (Survey) meets the need for up-to-date and far-reaching data, providing valuable qualitative information for which hard data sources are scarce or nonexistent, and thus complementing the hard data derived from various international sources.

The World Economic Forum has conducted the annual Survey for nearly 30 years. This year, the Survey was completed by 12,297 top management business leaders—an all-time high—in 134 countries between January and May. This represents an average of 91 respondents per country. Table 1 shows key attributes of the Survey respondents for the 2008 dataset.

The Survey asks the executives to provide their expert opinions on various aspects of the business environment in which they operate. The data gathered thus provide a unique source of insight and a qualitative portrait of each nation's economic and business environment, and how it compares with the situation in other countries.

Geographic expansion

Since the first competitiveness report was released in 1979, Survey coverage has been expanded from 16 European countries to this year's record coverage of 134 economies from all of the world's regions (see Figure 1 for details). This year four new countries have been added: Brunei Darussalam, Côte d'Ivoire, Ghana (previously covered in 2003 and 2004), and Malawi (previously covered between 2003 and 2006). Although the Forum aims to present comprehensive international coverage, expansion to additional countries may be constrained by the absence of adequate infrastructure to support the Survey process in some countries, and also because some of the hard data sources are themselves not available for some countries. However, despite the fact that some countries are not included in the *Report*, these 134 economies account for more than 98 percent of the world's gross domestic product (GDP), demonstrating that the findings are indeed global in scope.

Figure 1: Country/economy coverage of the Executive Opinion Survey

Survey structure and methodology

The Survey is reviewed and streamlined every year to reflect the variables captured in the Global Competitiveness Index (GCI), which is at the heart of this *Report*. Because of the scope of the Survey's coverage, it is translated into more than 20 different languages.

Most questions in the Survey follow a structure that asks participants to evaluate, on scale of 1 to 7, the current conditions of their particular operating environment. At one end of the scale, 1 represents the worst possible operating condition or situation, and at the other end of the scale, 7 represents the best. See Box 1 for an example.

The Forum collaborates closely with a network of over 140 Partner Institutes that administer the Executive Opinion Survey at the national level.¹ Typically, the Partner Institutes are recognized economics departments of national universities, independent research institutes, or business organizations. This valuable collaboration helps to ensure that the Survey is conducted in a consistent manner across the globe. In addition, our partners help us in explaining the results at the national level. This better ensures that the findings are used as a tool for improving the competitiveness outlook in each country.

To this end, and in order to reach a representative sample of Survey responses from each economy, the Partner Institutes are each year required to follow a detailed set of guidelines. The process was reinforced this

Box 1: Example of a typical Survey question

Intellectual property protection in your country:

Is weak and not enforced < 1 2 3 4 5 6 7 > Is strong and enforced

Circling 1....means you agree completely with the answer on the left-hand side

Circling 2....means you largely agree with the left-hand side

Circling 3....means you somewhat agree with the left-hand side

Circling 4....means your opinion is indifferent between the two answers

Circling 5....means you somewhat agree with the right-hand side

Circling 6....means you largely agree with the right-hand side

Circling 7....means you agree completely with the answer on the right-hand side

year with the support of an internationally renowned survey consultancy and in collaboration between the World Economic Forum and the Institute of Strategy and Competitiveness at the Harvard Business School. In this way, the process is moving toward a best practice procedure, ensuring greater data accuracy and allowing for more robust comparison across economies.

The Survey sampling follows a dual stratification based on the size of the company and the sector of activity.² Specifically, the Survey sampling guidelines ask the Partner Institutes to carry out the following steps:

1. Prepare a “sample frame,” or large list of potential respondents, which includes firms representing the main sectors of the economy (agriculture, manufacturing industry, non-manufacturing industry, and services).
2. Separate the frame into two lists: one that includes only large firms, and a second list that includes all other firms (both lists representing the various economic sectors).³
3. Based on these lists, and in view of reducing survey bias, choose a random selection of these firms to receive the Survey.⁴

Despite the significantly increased complexity of the process this year, the 2008 Survey guidelines were followed by a large majority of Partner Institutes, improving the robustness of the sample. However, this year should be seen as a transition year, as some Partner Institutes were not yet able to implement the improved procedure fully. We expect to move much closer to a situation of full implementation in the coming year or two.

Beyond the sampling guidelines, the actual administration of the Survey to the selected group of companies is tailored at the national level to take into account differences in infrastructure, distance, cultural preferences, and other such issues. For example, in some instances, the Partner Institute may deem that face-to-face interviews with business executives are the most effective method, as opposed to a mailing or telephone interview method, or offering the online version as an alternative.

Over the past year, the online completion of the Survey has increased further, and now represents 20 percent of all responses, with over 20 countries having an online usage above 70 percent. An improved online Survey was introduced this year, which allows for the inclusion of non-Latin-based languages, making the online Survey available in 13 languages.

Beyond the administration of the Executive Opinion Survey, the Partner Institutes act as the ambassadors of *The Global Competitiveness Report* and the report series. This often includes holding press events at the national level at the time of the launch, and explaining the Index findings to the public throughout the year.

Who else uses the Executive Opinion Survey?

The Executive Opinion Survey results serve as a major component of research by a number of international and national organizations, government bodies, and companies. Besides our Partner Institutes, some of our principal partners include the US Agency for International Development (USAID) for monitoring economic progress; Transparency International for their research on bribery and corruption; and Harvard University, in collaboration with the Forum’s Health Initiative, in their annual global review of business perceptions and their response to the HIV/AIDS epidemic. Moreover, reference to the Survey data is made by many other international and multilateral organizations, government research departments, and academic institutions.

Every year the World Economic Forum’s Global Competitiveness Network publishes a number of reports besides *The Global Competitiveness Report* for which the underlying data are taken from the Survey. From the Survey 2007, the Forum published a series of industry-specific studies, including the annual *Global Information Technology Report 2007–2008* and *The Travel & Tourism Competitiveness Report 2008*, as well as the first ever *Global Enabling Trade Report 2008* and *The Financial Development Report 2008*.

Finally, an increasing number of national competitiveness reports that make use of or refer to the Executive Opinion Survey data are being published worldwide.

Data treatment and score computation

The previous sections described how the Survey is actually conducted and the data collected. The following pages describe in detail how the data are then processed to arrive at country-level scores. These results,⁵ together with hard data indicators, then feed into the GCI, described in Chapter 1.1 of this *Report*.

Data editing

The collected respondent-level data are subjected to a careful editing process. The first editing rule consists of excluding those surveys with a completion rate inferior to 50 percent.⁶ This is because partially completed surveys likely demonstrate a lack of sufficient focus on the part of the respondent. In a second step, a multivariate outlier analysis is applied to the data using the Mahalanobis distance technique. This test assesses whether each individual survey is representative, given the overall sample of survey responses in the specific country, and allows for the deletion of clear outliers. (See Box 2 for more detail.)

Box 2: A multivariate outlier detection technique: The Mahalanobis distance

The Mahalanobis distance measure is used to estimate the likelihood that one particular point of N dimensions belongs to a set of such points. It extends a standard Euclidean measure of distance by taking into account the variance and covariance of points in the set across the N dimensions. It is therefore perfectly suited to the treatment of survey data. In effect, one single survey made up of N answers can be viewed as the point of N dimensions, while a particular country sample c is the set of points. The Mahalanobis distance is used to compute the probability that any survey i does not belong to the sample c . If the probability is high enough—we use 99.9 percent as the threshold—we conclude that a particular survey is a clear outlier and does not “belong” to the sample.

There is a limitation in applying this technique to the Survey data. In order to compute the Mahalanobis distance, the number of surveys in a country (i.e., the set of points) must be greater than the number of questions considered (i.e., the dimension or “degree of freedom”). Given the limited number of respondents in many countries, we cannot include all the Survey questions—over 150—and therefore limit the test to a group of 67 questions, selected for their relevance and placement in the Survey instrument. This allows us to calculate the measure in 106 country samples.¹

Note

1 A total of 71 surveys in 10 countries are dropped based upon the Mahalanobis outlier test.

Following the multivariate outlier test, a univariate outlier test is applied at the country level for each question of each Survey. We use the standardized score method—also called “z-score”—which indicates by how many standard deviations any one individual answer deviates from the mean of the country sample. Formally, this is calculated as follows:

$$z_{i,q,c} = \frac{x_{i,q,c} - \bar{x}_{q,c}}{\sigma_{q,c}},$$

where

$x_{i,q,c}$ is respondent i 's answer to question q in country c ; and

$\bar{x}_{q,c}$ and $\sigma_{q,c}$ are the average and standard deviation, respectively, of individual answers to question q within country c 's sample.

Individual answers with a z-score $z_{i,q,c}$ greater than 3 or less than negative 3 are dropped.

Data weighting: Sector-weighted country averages

Once the data have been edited, individual answers are aggregated at the country level. We compute sector-weighted country averages to obtain a more representative average that takes into account the structure of a country's economy. The structure is defined by the known contributions to a country's gross domestic product of each of the four main economic sectors: agriculture, manufacturing industry, non-manufacturing industry, and services (see Table 2).⁷

An additional step is taken to prevent individual responses within a sample from receiving an excessive weight when the structure of the sample and the underlying economy differ greatly. As an extreme example, imagine that just 3 percent of responses from a country came from the services sector, but that sector actually represents 90 percent of the country's economy. (In practice we do not find such extremely misrepresentative samples in our data.) By applying the above weighting scheme, we would be giving a very high weight to a very few surveys. This is avoided by trimming the sector weights. More specifically, when for a country the ratio of the weight of one sector in the economy to the percentage of surveys from that sector in the country sample exceeds 5, the sector weight used for the weighted average is capped to five times the percentage of surveys from that sector in the sample. The weights of the other sectors are adjusted accordingly.

Formally, the sector-weighted country average of a Survey indicator, \bar{q}_c , is computed as follows:

$$\bar{q}_c = \sum_s w_{s,c} \times q_{s,c}$$

$$\text{with } q_{s,c} = \sum_j \frac{q_{j,s,c}}{N_{s,c}},$$

where

$w_{s,c}$ is sector s 's contribution to the economy of country c (for example, .77 for the services sector in the United States);

$q_{s,c}$ is the mean of the responses from sector s in country c ($q_{j,s,c}$ is response j from sector s and country c and $N_{s,c}$ is the number of responses from sector s in country c).

Data weighting: Moving average

As a final step, the sector-weighted country averages for 2008 are combined with the 2007 averages to produce the final country scores that are used for the computation of the 2008 GCI and other projects.⁸

This moving average technique, which was introduced last year, consists of taking a weighted average of the most recent year's Survey results together with a discounted average of the previous year. There are

Note: Data are for 2007 or most recent year available.

(Cont'd.)

Box 3: Country score calculation

For any given Survey question q_i , country c 's score, $q_{i,c}^{07-08}$, is given by:

$$q_{i,c}^{07-08} = w_c^{2007} \times \bar{q}_{i,c}^{2007} + w_c^{2008} \times \bar{q}_{i,c}^{2008} \quad (1)$$

where

$\bar{q}_{i,c}^T$ is country c 's score on question q_i in year T , with $T = 2007, 2008$, as computed following the approach described in the text;

$q_{i,n,c}^T$ is respondent n 's response (on a 1–7 scale) to question q_i in year T ;

N_c^T is the sample size (i.e., the number of respondents) for country c in year T ; and

w_c^T is the weight applied to country c 's score in year T (see below).

The weights for each year are determined as follows:

$$w_c^{2007} = \frac{(1-\alpha) + \frac{N_c^{2007}}{N_c^{2007} + N_c^{2008}}}{2} \quad (2a)$$

and

$$w_c^{2008} = \frac{\alpha + \frac{N_c^{2008}}{N_c^{2007} + N_c^{2008}}}{2} \quad (2b)$$

Plugging equations (2a) and (2b) into (1) and rearranging yields:

$$q_{i,c}^{07-08} = \frac{1}{2} \times \underbrace{\left[(1-\alpha) \times \bar{q}_{i,c}^{2007} + \alpha \times \bar{q}_{i,c}^{2008} \right]}_{\text{discounted-past weighted average}} + \frac{1}{2} \times \underbrace{\left[\frac{N_c^{2007}}{N_c^{2007} + N_c^{2008}} \times \bar{q}_{i,c}^{2007} + \frac{N_c^{2008}}{N_c^{2007} + N_c^{2008}} \times \bar{q}_{i,c}^{2008} \right]}_{\text{sample-size weighted average}} \quad (3)$$

In equation (3), the first component of the weighting scheme is the discounted-past weighted average. The second component is the sample-size weighted average. The two components are given half-weight each. The value for α is 0.6, which corresponds to a discount factor of 2/3. That is, the 2007 score of country c is given 2/3 of the weight given to its 2008 score. One additional property of this approach is that it prevents a country sample that is much larger in one year from overwhelming the smaller sample from the other year.

The same treatment is applied to the results of the previous editions of the Survey. That is, for any two consecutive editions t_1 and t_2 of the EOS, country c 's score on question i is computed as follows:

$$q_{i,c}^{t_1-t_2} = \frac{1}{2} \times \left[(1-\alpha) \times \bar{q}_{i,c}^{t_1} + \alpha \times \bar{q}_{i,c}^{t_2} \right] + \frac{1}{2} \times \left[\frac{N_c^{t_1}}{N_c^{t_1} + N_c^{t_2}} \times \bar{q}_{i,c}^{t_1} + \frac{N_c^{t_2}}{N_c^{t_1} + N_c^{t_2}} \times \bar{q}_{i,c}^{t_2} \right] \quad (4)$$

Example

For the sake of concreteness and clarity, let us compute the score of Costa Rica on indicator 7.01 on the nature of the relations between employers and employees, which is part of the 7th pillar of the GCI.

Costa Rica's score was 5.61 in 2008 and 5.67 in 2007. The weighting scheme described above indicates how the two scores are combined. In Costa Rica, the size of the sample was 57 in 2007 and 72 in 2008. Using $\alpha = 0.6$ and applying formulas (2a) and (2b) yield weights of 44.2 percent for 2007 and 55.8 percent for 2008. The final country score for this question is given by formula (1):

$$\frac{0.442 \times 5.67}{2007} + \frac{0.558 \times 5.61}{2008} = 5.63.$$

This is the score used in the computation of the GCI. Although numbers were rounded to two decimal places in this example and are shown to one decimal place in the data tables, exact figures were used in the actual calculation.

several reasons for doing this. First, it makes results less sensitive to the specific point in time when the Survey is administered. Second, it increases the amount of available information by providing a larger sample size. Additionally, because the Survey is carried out during the first quarter of the year, the average of the responses in the first quarter of 2007 and first quarter 2008 better aligns the Survey data with many of the hard data indicators, which are year-average data.

Practically, to calculate the moving average, a weighting scheme is used that is composed of two overlapping elements. On one hand, we want to give each response an equal weight and, therefore, place more weight on the year with the larger sample size. At the same time, we would like to give more weight to the most recent responses because they contain more updated information. That is, we also “discount the past.” Box 3 details the methodology and provides a clarifying example.

Conclusion

The World Economic Forum’s Executive Opinion Survey is a unique tool for capturing the opinion of business leaders throughout the world concerning the many factors that not only impact the environment in which businesses operate, but in turn largely dictate the competitiveness of a nation. With coverage of 134 countries and with over 12,000 responses annually, the Survey is by far the largest poll of its kind. A project of this scale would not be possible without the incredible work carried out by the Forum’s network of over 140 Partner Institutes.

This year, the Survey has undergone a major overhaul with the help of world-class experts and practitioners. Improvements have been made throughout the process in order to further enhance the population representation of the sample and the statistical significance and the robustness of the results. In the future, we will continue to pursue efforts to enhance the Survey.

Notes

- 1 Please refer to the list of Partner Institutes at the beginning of this *Report*.
- 2 The Survey sampling guidelines each year emphasize the need to have a sample with a sufficient presence of large companies because these companies tend to have better knowledge about the overall economy and the relative quality of the business environment. The size stratification of the sample helps to better achieve this goal.
- 3 Company size is defined as the number of employees of the firm in the country of the Survey respondent. The company size value used for delineating the large and small company sample frames varies across countries. The size value tracks closely with the overall size of the economy. Adjustments were made to the value based on searches in company directories and data gathered through the administration of the Survey in past years.
- 4 In order to reach the required number of surveys in each country (80 for most economies and 300 for the BRIC countries and the United States), a Partner Institute uses the response rate from previous years.

- 5 The results are the scores obtained by each country in the various questions of the Survey. The two terms are used interchangeably throughout the text.
- 6 The completion rate is the proportion of unanswered questions among the 120 core questions in the survey instrument.
- 7 In a few cases, the respondent has not answered the question relative to their company’s activity. In order to include the surveys with missing sector information in the country averages, the average response values for the surveys without sector information are apportioned to the other sectors according to the sample sizes in those other sectors. This has the effect of including these surveys on a one-for-one basis as they occur in the sample—that is, with no adjustment for sector.
- 8 For details about the 2007 dataset of the Survey, please refer to Browne and Geiger 2007.

Country/Economy Profiles

How to Read the Country/Economy Profiles

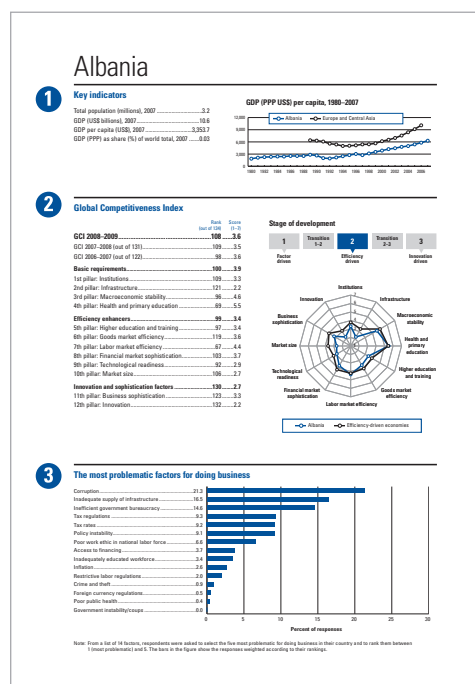

The Country Profiles section presents a two-page profile for each of the 134 economies covered by *The Global Competitiveness Report 2008–2009*.

Page 1

1 Key indicators

The first section presents a selection of key indicators:

- Population figures come from the United Nations Population Fund (UNFPA)'s *State of World Population 2007*, the World Bank's *World Development Indicators 2008*, and the Economist Intelligence Unit's *CountryData Database*, as well as national sources.
- Macroeconomic data come from the April 2008 edition of the International Monetary Fund (IMF)'s *World Economic Outlook*.
- The chart on the upper right-hand side displays the evolution of GDP per capita adjusted for purchasing power parity (PPP), from 1980 through 2007 (or the period for which data are available) for the economy under review (blue line). The source for these figures is the April 2008 edition of the IMF's *World Economic Outlook*. Note that no data are available for Montenegro and Puerto Rico. The black line plots the aggregate performance of the group of economies to which the economy under review belongs. We draw on the World Bank's classification of economies, which divides the world into six regions ("East Asia and the Pacific," "Europe and Central Asia," "Latin America and the Caribbean," "Middle East and North Africa," "South Asia," and "Sub-Saharan Africa") and two income groups ("high-income OECD" and "other high income"). In some cases, a different comparator than the economy's corresponding group is used. GDP aggregates (only available through 2006) are from the World Bank's *World Development Indicators Online Database* (data retrieved in August 2008).

2 Global Competitiveness Index

This section details the country's performance on the various components of the Global Competitiveness Index (GCI). The first column shows the country's ranks among the 134 economies, while the second column presents the scores. For more information on the methodology and results of the GCI, please refer to Chapter 1.1 of this *Report*.

On the right-hand side, a chart shows the country's performance in the 12 pillars of the GCI (blue line) measured up against the average scores across all the countries in the same stage of development (black line).

3 The most problematic factors for doing business

This chart summarizes those factors seen by business executives as the most problematic for doing business in their economy. The information is drawn from the 2008 edition of the World Economic Forum's Executive Opinion Survey. From a list of 15 factors, respondents were asked to select the five most problematic ones, and to rank those from 1 (most problematic) to 5. The results were then tabulated and weighted according to the ranking assigned by respondents.

4 The Global Competitiveness Index in detail

This page presents the rank achieved by a country on each of the indicators entering the composition of the GCI. Indicators are organized by pillar. Please refer to the appendix of Chapter 1.1 for the detailed structure of the GCI.

Next to the rank, a colored square indicates whether the indicator constitutes an advantage (blue square) or a disadvantage (black square) for the country. In order to identify variables as advantages or disadvantages, the following rules were applied:

- For those economies ranked in the top 10 in the overall GCI, individual variables ranked between 1 and 10 are considered to be advantages. Any variables ranked below 10 are considered to be disadvantages. For instance, in the case of Switzerland which is ranked 2nd overall, its 3rd rank in the variable *Efficiency of the legal framework* makes this variable a competitive advantage, whereas the time required to start a business, on which it ranks 42nd, constitutes a competitive disadvantage for the country.
- For those economies ranked from 11 to 50 in the overall GCI, variables ranked higher than the economy's own rank are considered to be advantages. Any variables ranked equal to or lower than the economy's overall rank are considered to be disadvantages. In the case of Malaysia, ranked 21st overall, its rank of 20th for the quality of scientific research institutions makes this variable a competitive advantage. On the other hand, the penetration rate of personal computers, in which Malaysia ranks 38th, represents a competitive disadvantage.
- For those economies ranked lower than 50 in the overall GCI, any individual variables ranked higher than 51 are considered as advantages. Any variables ranked lower than 50 are considered as disadvantages. For Vietnam, ranked 70th overall, variable *Extent of marketing* constitutes a disadvantage (98th), whereas the relatively narrow interest spread (3.7 percent) constitutes a competitive advantage (rank 39th).

For indicators allocated a half-weight in the GCI, only the first instance is shown on this page. For further analysis, the Data Tables in the following section of the Report provide detailed rankings and scores for all the variables of the GCI.

The Global Competitiveness Index in detail		Competitive Advantage		Competitive Disadvantage	
INDICATOR	RANK	INDICATOR	RANK	INDICATOR	RANK
1st pillar: Institutions					
1.01 Property rights	136	6.01 Intensity of local competition	127	10.01 Capacity for innovation	134

3rd pillar: Macroeconomic stability					
3.01 Government applicability*	113				
3.02 Nominal wage rate**	110				
3.03 Inflation**	47				
3.04 Interest rate spread**	105				
3.05 Government debt**	94				
4th pillar: Health and primary education					
4.01 Business impact of malaria	82				
4.02 Malaria incidence**	7				
4.03 Business impact of tuberculosis	44				
4.04 Business impact of HIV/AIDS	27				
4.05 HIV prevalence**	56				
4.06 Infant mortality**	44				
4.07 Life expectancy**	74				
4.08 Life expectancy**	74				
4.09 Quality of primary education	71				
4.10 Primary enrollment**	65				
4.11 Education expenditure**	99				
5th pillar: Higher education and training					
5.01 Secondary enrollment**	88				
5.02 Tertiary enrollment**	83				
5.03 Quality of the educational system	80				
5.04 Quality of staff and science education	82				
5.05 Quality of management schools	112				
5.06 Incentive of science institutions	107				
5.07 Local investment in research and training services	104				
5.08 Extent of staff training	71				
6th pillar: Financial market sophistication					
6.01 Financing through capital equity market	126				
6.02 Ease of access to bank	71				
6.03 Bank credit availability	103				
6.04 Restriction on capital flows	103				
6.05 Strength of investor protection*	123				
6.07 Soundness of banks	104				
6.08 Regulation of derivative exchanges	134				
6.09 Legal rights index*	3				
7th pillar: Technological readiness					
7.01 Firm-level technology adoption	104				
7.02 Firm-level technology adoption	104				
7.03 Firm-level technology adoption	104				
7.04 Firm-level technology adoption	104				
7.05 Mobile telephone subscriptions**	74				
7.06 Mobile telephone subscriptions**	74				
7.07 Personal computers**	38				
7.08 Personal computers**	38				
7.09 Bandwidth of Internet subscriptions**	117				
8th pillar: Market size					
8.01 Domestic market size*	99				
8.02 Foreign market size*	116				
9th pillar: Business sophistication					
9.01 Local supplier quality	131				
9.02 Local supplier quality	131				
9.03 Local supplier quality	131				
9.04 Local supplier quality	131				
9.05 Degree of subcontracting	120				
9.06 Nature of competitive advantage	125				
9.07 Nature of competitive advantage	125				
9.08 Control of international distribution	91				
9.09 Production process sophistication	82				
9.10 Extent of marketing	92				
9.11 Willingness to delegate authority	117				
10th pillar: Innovation					
10.01 Capacity for innovation	134				
10.02 Quality of scientific research institutions	133				
10.03 Complexity of patent law	132				
10.04 University-industry research collaboration	134				
10.05 Government of standardization	130				
10.06 Availability of scientists and engineers	116				
10.07 Hiring pattern**	88

2.3

Data Tables

How to Read the Data Tables

The following pages provide detailed data for all 134 economies included in the *The Global Competitiveness Report 2008–2009*. The data tables are organized into 13 sections:

- Basic indicators**
- I. Institutions
 - II. Infrastructure
 - III. Macroeconomic stability
 - IV. Health and primary education
 - V. Higher education and training
 - VI. Goods market efficiency
 - VII. Labor market efficiency
 - VIII. Financial market sophistication
 - IX. Technological readiness
 - X. Market size
 - XI. Business sophistication
 - XII. Innovation

The 12 numbered sections correspond to the 12 pillars of the Global Competitiveness Index.

Two types of data are presented in the tables:

- **Survey data:** These data are the results drawn from the World Economic Forum's Executive Opinion Survey.
- **Hard data:** These data are indicators obtained from a variety of sources.

Survey data

1 Data yielded from the World Economic Forum's Executive Opinion Survey are presented in blue-colored bar graphs. Survey questions asked for responses on a scale of 1 to 7, where an answer of 1 corresponds to the lowest possible score and an answer of 7 corresponds to the highest possible score. For each Survey question, individual responses are aggregated at country level in order to produce country scores. For more information on the Executive Opinion Survey and a detailed explanation of how country scores are computed, please refer to Chapter 2.1.

For each Survey variable, the corresponding Survey question and the two extreme answers are shown. Scores are reported with a precision of one decimal point, although exact figures are used to determine rankings. For example, in the case of variable 1.01 on property rights, Singapore's score is 6.52260, Finland's score is 6.51033, Germany's score is 6.50559, and Sweden's score is 6.50394. These countries are ranked 4th, 5th, 6th, and 7th, respectively, although they are all listed with the same rounded score of 6.5.

2 A dotted line on the graph indicates the mean score across the 134 economies.

3 0.03 GDP (current prices) per capita (hard data)

Gross domestic product (current prices) per capita in US dollars | 2007

RANK	COUNTRY/ECONOMY	HARD DATA	RANK	COUNTRY/ECONOMY	HARD DATA
1	Luxembourg	104,873.3	69	Bhijige	5,186.4

SOURCE: IMF, World Economic Outlook Database (April 2008); European Bank for Reconstruction and Development; national sources

Hard data

While Survey data provide qualitative information, hard data provide an objective measure of a quantity (for example, gross domestic product, malaria incidence, number of personal computers, number of procedures required to start a business, and so on). We use the latest data available from international organizations (such as the International Monetary Fund, the World Bank, various United Nations agencies, and the International Telecommunication Union), completed, if necessary, by national sources. In the following pages, hard data variables are presented in black-shaded bar graphs. For each indicator, a short description appears at the top of the page. The *base year* (i.e., the year when a majority of the data was collected) follows the description. When the year differs from the base year for a particular country, this is indicated in a footnote. A more detailed description and the full source for each variable can be found in the Technical Notes and Sources section at the end of this *Report*. When data are not available or are too outdated, “n/a” is used in lieu of the rank and the value.

In the case of hard data, true ties between two or more countries are possible. In such cases, shared rankings are indicated accordingly. For example, the number of procedures required to start a business—just two—is the same in Australia, Canada, and New Zealand. As a result, the three countries share the first position in Table 6.06.

(Cont'd.)

Section IX: Technological readiness459

9.01	Availability of latest technologies	460
9.02	Firm-level technology absorption	461
9.03	Laws relating to ICT	462
9.04	FDI and technology transfer.....	463
9.05	Mobile telephone subscribers (hard data)	464
9.06	Internet users (hard data).....	465
9.07	Personal computers (hard data)	466
9.08	Broadband Internet subscribers (hard data)	467

Section X: Market size.....469

10.01	Domestic market size index (hard data).....	470
10.02	Foreign market size index (hard data)	471
10.03	GDP valued at PPP (hard data).....	472
10.04	Imports as a percentage of GDP (hard data)	473
10.05	Exports as a percentage of GDP (hard data).....	474

Section XI: Business sophistication475

11.01	Local supplier quantity	476
11.02	Local supplier quality.....	477
11.03	State of cluster development.....	478
11.04	Nature of competitive advantage	479
11.05	Value chain breadth	480
11.06	Control of international distribution.....	481
11.07	Production process sophistication	482
11.08	Extent of marketing.....	483
11.09	Willingness to delegate authority.....	484

Section XII: Innovation485

12.01	Capacity for innovation.....	486
12.02	Quality of scientific research institutions	487
12.03	Company spending on R&D.....	488
12.04	University-industry research collaboration	489
12.05	Government procurement of advanced technology products.....	490
12.06	Availability of scientists and engineers	491
12.07	Utility patents (hard data)	492

Section VII

Labor market efficiency

7.01 Cooperation in labor-employer relations

Labor-employer relations in your country are (1 = generally confrontational, 7 = generally cooperative)

SOURCE: World Economic Forum, Executive Opinion Survey 2007, 2008

7.02 Flexibility of wage determination

In your country, wages are (1 = set by a centralized bargaining process, 7 = up to each individual company)

SOURCE: World Economic Forum, Executive Opinion Survey 2007, 2008

7.03 Non-wage labor costs (hard data)

This variable estimates social security payments and payroll taxes associated with hiring an employee in fiscal year 2006, expressed as a percentage of the worker's salary | 2007

Technical Notes and Sources

The following section complements the Data Tables by providing additional information and definitions for the hard data indicators that enter the composition of the Global Competitiveness Index 2008–2009. In the following pages, the number next to the variable corresponds to the number of the Data Table that shows the ranks and scores for all countries/economies on this particular indicator.

The data used in this *Report* represent the best available estimates from various international agencies, private sources, and national authorities at the time the *Report* was prepared. It is possible that some data will have been updated or revised after publication.

Basic indicators

0.01 GDP valued at current prices (hard data)

[Gross domestic product \(current prices\) in millions of US dollars | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); national sources

0.02 Population (hard data)

[Population in millions | 2007](#)

Source: UNFPA, *State of World Population 2007*; IMF, *World Economic Outlook Database* (April 2008); Economist Intelligence Unit, *CountryData Database* (May 2008); national sources

0.03 GDP (current prices) per capita (hard data)

[Gross domestic product \(current prices\) per capita in US dollars | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); European Bank for Reconstruction and Development; national sources

Section II: Infrastructure

2.06 Available seat kilometers (hard data)

[Scheduled available seat kilometers per week originating in country \(in millions\) | January 2008 and June 2008 average](#)

This variable measures an airline's passenger-carrying capacity; it is composed of the number of seats available on each flight originating in the country multiplied by the flight distance in kilometers. The resulting variable is an average of the total for all scheduled flights in a week during January (winter schedule) and June (summer schedule) 2008.

Source: International Air Transport Association, SRS Analyser

2.08 Telephone lines (hard data)

[Main telephone lines per 100 population | 2006](#)

A main telephone line is a telephone line connecting the subscriber's terminal equipment to the public switched telephone network and that has a dedicated port in the telephone exchange equipment.

Source: International Telecommunication Union, *World Telecommunication Indicators* (June 2008 update); national sources

Section III: Macroeconomic stability

3.01 Government surplus/deficit (hard data)

[Central government gross surplus/deficit as a percentage of GDP | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); IMF country reports; European Central Bank; European Bank for Reconstruction and Development; African Development Bank; Economist Intelligence Unit, *CountryData Database* (June 2008); national sources

3.02 National savings rate (hard data)

[National savings rate as a percentage of GDP | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); Economist Intelligence Unit, *CountryData Database* (June 2008); The World Bank, *World Development Indicators 2008*; national sources

3.03 Inflation (hard data)

[Annual percent change in consumer price index | 2007 average](#)

Source: IMF, *World Economic Outlook Database* (April 2008); national sources

3.04 Interest rate spread (hard data)

[Average interest rate spread \(difference between typical lending and deposit rates\) | 2007](#)

This measures the difference between the typical short-term lending and deposit rates.

Source: IMF, *International Financial Statistics*; Economist Intelligence Unit, *CountryData Database* (June 2008); *World Development Indicators 2008*; national sources

3.05 Government debt (hard data)

[Government gross debt as a percentage of GDP | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); IMF country reports; OECD, *OECD Economic Outlook* no. 83 (June 2008); European Central Bank; European Bank for Reconstruction and Development; Economist Intelligence Unit, *CountryData Database* (June 2008); national sources

Section IV: Health and primary education

4.02 Malaria incidence (hard data)

[Number of malaria cases per 100,000 population | 2003](#)

Source: World Health Organization, *Global Health Atlas* database (July 2008); World Health Organization Regional Offices; The World Bank, *World Development Indicators 2007*; UNDP, *Human Development Report 2006*; national sources

4.04 Tuberculosis incidence (hard data)

[Number of tuberculosis cases per 100,000 population | 2006](#)

Source: World Health Organization, *Global Atlas of Infectious Diseases* database (May 2008); national sources

4.06 HIV prevalence (hard data)

[HIV prevalence as a percentage of adults aged 15–49 years | 2007](#)

Source: UNAIDS, *2008 Report on the Global AIDS Epidemic*; UNDP, *Human Development Report 2006*; national sources

4.07 Infant mortality (hard data)

[Infant \(children aged 0–12 months\) mortality per 1,000 live births | 2005](#)

Source: World Health Organization, *WHO Statistical Information System (WHOSIS)* (May 2008); national sources

4.08 Life expectancy (hard data)

[Life expectancy at birth \(years\) | 2006](#)

Source: World Health Organization, *WHO Statistical Information System (WHOSIS)* (May 2008); UNDP, *Human Development Report 2007/2008* online database (May 2008); national sources

4.10 Primary enrollment (hard data)

[Net primary education enrollment rate | 2006](#)

According to the World Bank's *World Development Indicators*, this corresponds to the ratio of children of official school age (as defined by the national education system) who are enrolled in school to the population of the corresponding official school age. Primary education provides children with basic reading, writing, and mathematics skills along with an elementary understanding of such subjects as history, geography, natural science, social science, art, and music.

Source: UNESCO Institute for Statistics (June 2008); The World Bank, *World Development Indicators 2008*; national sources

4.11 Education expenditure (hard data)

[Adjusted savings: Education expenditure as percentage of GNI | 2006](#)

Current operating expenditures in education, including wages and salaries and excluding capital investments in buildings and equipment.

Source: The World Bank, *World Development Indicators 2008*; national sources

Section V: Higher education and training

5.01 Secondary enrollment (hard data)

[Gross secondary education enrollment rate | 2006](#)

According to the World Bank's *World Development Indicators*, this corresponds to the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the secondary education level. Secondary education completes the provision of basic education that began at the primary level, and aims at laying the foundations for lifelong learning and human development, by offering more subject- or skill-oriented instruction using more specialized teachers.

Source: UNESCO Institute for Statistics (June 2008); The World Bank, *World Development Indicators 2008*; national sources

5.02 Tertiary enrollment (hard data)

[Gross tertiary education enrollment rate | 2006](#)

According to the World Bank's *World Development Indicators*, this corresponds to the ratio of total enrollment, regardless of age, to the population of the age group that officially corresponds to the tertiary education level. Tertiary education, whether or not leading to an advanced research qualification, normally requires, as a minimum condition of admission, the successful completion of education at the secondary level.

Source: UNESCO Institute for Statistics (June 2008); The World Bank, *World Development Indicators 2008*; national sources

Section VI: Goods market efficiency

6.05 Total tax rate (hard data)

This variable is a combination of profit tax (% of profits), labor tax and contribution (% of profits), and other taxes (% of profits) | 2007

Source: The World Bank, *Doing Business 2008*

6.06 Number of procedures required to start a business (hard data)

[Number of procedures required to start a business | 2007](#)

Source: The World Bank, *Doing Business 2008*

6.07 Time required to start a business (hard data)

[Number of days required to start a business | 2007](#)

Source: The World Bank, *Doing Business 2008*

6.10 Trade-weighted tariff rate (hard data)

[The average rate of duty per imported value unit | 2007](#)

This variable measures the average rate of duty per imported value unit weighted by 2006 imports value.

Source: International Trade Centre

Section VII: Labor market efficiency

7.03 Non-wage labor costs (hard data)

This variable estimates social security payments and payroll taxes associated with hiring an employee in fiscal year 2006, expressed as a percentage of the worker's salary | 2007

Social security payments include retirement fund, sickness, maternity and health insurance, workplace injury, family allowance, and other obligatory contributions.

Source: The World Bank, *Doing Business 2008*

7.04 Rigidity of employment (hard data)

[Rigidity of Employment Index on a 0–100 \(worst\) scale | 2007](#)

This index is the average of three subindexes: Difficulty of hiring, Rigidity of hours, and Difficulty of firing. The three subindexes have several components and all take values between 0 and 100, with higher values indicating more rigid regulation.

Source: The World Bank, *Doing Business 2008*

7.06 Firing costs (hard data)

[Firing costs \(in weeks of wages\) | 2007](#)

This variable estimates the cost of advance notice requirements, severance payments, and penalties due when terminating a redundant worker, expressed in weekly wages.

Source: The World Bank, *Doing Business 2008*

7.10 Female participation in labor force (hard data)

[Female participation in the labor force as a percentage of male participation | 2006](#)

This measure is the percentage of women aged 14–65 participating in the labor force divided by the percentage of men aged 14–65 participating in the labor force.

Source: International Labour Organization, *Key Indicators of the Labour Market (KILM) 5th Edition* (2006)

Section VIII: Financial market sophistication

8.06 Strength of investor protection (hard data)

[Strength of Investor Protection Index on a 0–10 \(best\) scale | 2007](#)

This variable is a combination of the Extent of disclosure index (transparency of transactions), the Extent of director liability index (liability for self-dealing), and the Ease of shareholder suit index (shareholders' ability to sue officers and directors for misconduct).

Source: The World Bank, *Doing Business 2008*

8.09 Legal rights index (hard data)

[Strength of legal rights index on a 0–10 \(best\) scale | 2007](#)

This index measures the degree to which collateral and bankruptcy laws protect borrowers and lenders' rights and thus facilitate lending.

Source: The World Bank, *Doing Business 2008*

Section IX: Technological readiness

9.05 Mobile telephone subscribers (hard data)

[Mobile telephone subscribers per 100 population | 2006](#)

The term *subscribers* refers to users of mobile telephones subscribing to an automatic public mobile telephone service that provides access to the public switched telephone network using cellular technology. This can include analogue and digital cellular systems but should not include non-cellular systems. Subscribers to fixed wireless, public mobile data services, or radio paging services are not included.

Source: International Telecommunication Union, *World Telecommunication Indicators* (June 2008 update); national sources

9.06 Internet users (hard data)

[Internet users per 100 population | 2006](#)

Internet users are people with access to the worldwide network.

Source: International Telecommunication Union, *World Telecommunication Indicators* (June 2008 update); national sources

9.07 Personal computers (hard data)

[Personal computers per 100 population | 2006](#)

According to the World Bank, *personal computers* are self-contained computers designed to be used by a single individual.

Source: International Telecommunication Union, *World Telecommunication Indicators* (June 2008 update); national sources

9.08 Broadband Internet subscribers (hard data)

[Broadband internet subscribers per 100 population | 2006](#)

The International Telecommunication Union considers broadband to be any dedicated connection to the Internet of 256 kilobits per second or faster, in both directions. *Broadband subscribers* refers to the sum of DSL, cable modem, and other broadband (for example, fiber optic, fixed wireless, apartment LANs, satellite connections) subscribers.

Source: International Telecommunication Union, *World Telecommunication Indicators* (June 2008 update); national sources

Section X: Market size

10.01 Domestic market size index (hard data)

[Sum of gross domestic product plus value of imports of goods and services, minus the value of exports of goods and services, normalized on a 1–7 \(best\) scale | 2007](#)

The size of the domestic market is estimated as the natural log of the sum of the gross domestic product valued at PPP plus the total value (PPP estimates) of imports of goods and services, minus the total value (PPP estimates) of exports of goods and services. Data are then normalized on a 1–7 scale. PPP estimates of imports and exports are obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP.

Source: Authors' calculations; IMF, *World Economic Outlook Database* (April 2008); Economist Intelligence Unit, *CountryData Database* (May 2008); The World Bank, *World Development Indicators 2008*; national sources

10.02 Foreign market size index (hard data)

[Value of exports of goods and services, normalized on a 1–7 \(best\) scale | 2007](#)

The size of the foreign market is estimated as the natural log of the total value (PPP estimates) of exports of goods and services, normalized on a 1–7 scale. PPP estimates of exports is obtained by taking the product of exports as a percentage of GDP and GDP valued at PPP.

Source: Authors' calculations; IMF, *World Economic Outlook Database* (April 2008); Economist Intelligence Unit, *CountryData Database* (May 2008); The World Bank, *World Development Indicators 2008*; national sources

10.03 GDP valued at PPP (hard data)

[Gross domestic product valued at purchasing power parity in millions of international dollars | 2007](#)

Source: IMF, *World Economic Outlook Database* (April 2008); national sources

10.04 Imports as a percentage of GDP (hard data)

[Imports of goods and services as a percentage of GDP | 2007](#)

Source: Economist Intelligence Unit, *CountryData Database* (May 2008); The World Bank, *World Development Indicators 2007*; national sources

10.05 Exports as a percentage of GDP (hard data)

[Exports of goods and services as a percentage of GDP | 2007](#)

Source: Economist Intelligence Unit, *CountryData Database* (May 2007); The World Bank, *World Development Indicators 2007*; The World Bank, *World Development Indicators 2008*; national sources

Section XII: Innovation

12.07 Utility patents (hard data)

[Number of utility patents \(i.e., patents for invention\) granted between January 1 and December 31, 2007, per million population | 2007](#)

Utility patents are recorded such that the origin of the patent is determined by the first-named inventor at the time of the grant. Patents per million population are calculated by dividing the number of patents granted to a country in 2006 by that country's population in the same year.

Source: The United States Patent and Trademark Office (June 2008)

About the Authors

Jennifer Blanke

Jennifer Blanke is Director and Senior Economist, and Head of the Global Competitiveness Network at the World Economic Forum. Since joining the team in 2002, she has written and lectured extensively on issues related to national competitiveness and has served as lead editor on a number of regional and topical competitiveness reports. From 1998 to 2002, she was Senior Programme Manager responsible for developing the business, management, and technology section of the World Economic Forum's Annual Meeting in Davos. Before joining the Forum, Dr Blanke worked for a number of years as a management consultant for Eurogroup, Mazars Group in Paris, France, where she specialized in banking and financial market organization. Dr Blanke obtained a Master of International Affairs from Columbia University and an MA and a PhD in International Economics from the Graduate Institute of International Studies (Geneva).

Ciara Browne

Ciara Browne is Senior Manager of the Global Competitiveness Network at the World Economic Forum, where her responsibilities include coordinating the Executive Opinion Survey process and managing the network of over 140 Partner Institutes worldwide, as well as providing input into *The Global Competitiveness Report* and several of the Forum's other benchmarking studies. She also works closely with the Forum's media team in articulating the findings of the various competitiveness reports to the media and the public. Before joining the Forum, she served for several years with the International Organization for Migration, where she worked for a mass claims processing program. She has a BA (Hons) degree from the University of Manchester.

Richard Bryden

Richard Bryden is a member of the research staff at the Institute for Strategy and Competitiveness at Harvard Business School, where he has participated in numerous research projects, case studies, and regional analyses on the topic of economic development. As Director of Information Products at the Institute, he has particular responsibility for developing and publishing the Institute's unique datasets covering the cluster competitiveness of nations and regions. He holds a Master of Business Administration from the University of Chicago.

Mercedes Delgado

Mercedes Delgado is an Assistant Professor at the Fox School of Business at Temple University, and a member of the Institute for Strategy and Competitiveness at the Harvard Business School. Before joining Temple University, she was a Post-Doctoral Fellow at the Institute for Strategy and Competitiveness and also at the Innovation Policy and the Economy Group of the National Bureau of Economic Research. Professor Delgado's research focuses on the interaction between the micro-economic business environment and the performance of firms, regions, and countries.

Margareta Drzeniek Hanouz

Margareta Drzeniek Hanouz is Director and Senior Economist with the Global Competitiveness Network at the World Economic Forum, where she researches and writes on issues of national competitiveness, in particular related to the Arab world, Eastern Europe, and international trade. She is lead author or editor of a number of regional and topical reports and papers. Previously, she oversaw the economic modeling for some of the Forum's scenario projects and was charged with developing the economics section of the program for the World Economic Forum's Annual Meeting in Davos. Before joining the Global Competitiveness Network, Dr Drzeniek Hanouz worked for several years with the International Trade Centre in Geneva, where she was in charge of relations with Central and Eastern European countries. In this capacity, she advised governments and developed and implemented programs to strengthen the international competitiveness of businesses in the region. Dr Drzeniek Hanouz received a Diploma in Economics from the University of Münster and holds a PhD in International Economics from the University of Bochum, both in Germany.

Thierry Geiger

Thierry Geiger is an Economist with the Global Competitiveness Network and a Global Leadership Fellow at the World Economic Forum. His responsibilities include the construction and computation of a range of indexes, as well as data analysis for various projects and studies. His main areas of expertise include econometrics, international trade, and finance. Most recently, he co-edited *The Ukraine Competitiveness Report 2008*. He is also co-author of *The Global Competitiveness Report* series and *The Global Enabling Trade Report*, as well as a contributor to *The Global Information Technology Report* and *The Travel & Tourism Competitiveness Report*. A Swiss national, Mr Geiger holds a BA in Economics from the University of Geneva with a specialization in monetary and financial economics, and an MA in Economics from the University of British Columbia. Prior to joining the Forum, he worked for the World Trade Organization and Caterpillar Inc. During his studies, he was a member of the board of Junior Entreprise Genève. He is also co-founder of Procab Studio SA, an IT company based in Geneva.

Christian Ketels

Christian Ketels is a member of the Harvard Business School faculty at Professor Michael E. Porter's Institute for Strategy and Competitiveness. He is currently also a Senior Research Fellow at the Stockholm School of Economics; a Director of TCI, a not-for-profit global network of practitioners in competitiveness, clusters, and regional innovation; and serves on the advisory boards of a number of policy advisory groups in Asia, Europe, and the Americas. Dr Ketels has worked with many countries, regions, and clusters around the world and has written extensively on strategic competitiveness issues facing locations and companies. He holds a PhD (Econ) from the London School of Economics and further degrees from the Kiel Institute for World Economics and Cologne University.

Irene Mia

Irene Mia is Director and Senior Economist with the Global Competitiveness Network at the World Economic Forum. She is also responsible for competitiveness research on Latin America and Iberia. She has written and spoken extensively on issues related to national competitiveness, serving as lead author and editor on a number of regional and topical competitiveness papers and reports; notably, she is the co-editor of *The Global Information Technology Report* series. Before joining the Forum, she worked at the headquarters of Sudameris Bank in Paris for a number of years, holding various positions in the international affairs and international trade divisions. Her main research interests are in the fields of development, international trade, economic integration (with special reference to the Latin American region), and competitiveness. Dr Mia holds an MA in Latin American Studies from the Institute of Latin American Studies, London University, and a PhD in International Economic and Trade Law from Bocconi University.

Fiona Paua

Fiona Paua is Head of Strategic Insight Teams at the World Economic Forum, where she leads the Global Competitiveness, Global Risks, and Scenario Planning teams. She is also the Head of the Network of Global Agenda Councils, which brings together the most innovative and relevant leaders to address the important global, regional, and industry challenges. In her capacity as Senior Adviser to the Executive Chairman, she also launched the Forum of Young Global Leaders and the Global Leadership Fellows Programme. She joined the World Economic Forum as Economist for the Global Competitiveness Network and has served as co-editor of *The Global Information Technology Report* series. Previously, she was Vice President and the Country Head of Research for Citibank Philippines and a financial analyst at Goldman Sachs in the United States, Hong Kong, and Singapore. She is the co-founder of b2bpricenow.com, winner of the 2001 Development Marketplace Award and Infodev Award of the World Bank. Ms Paua has a BA dual honors degree in Asian Studies and Government from Dartmouth College and a Master of Public Administration from the John F. Kennedy School of Government at Harvard University.

Michael E. Porter

Michael E. Porter is the Bishop William Lawrence University Professor at the Institute for Strategy and Competitiveness, based at the Harvard Business School. He is a leading authority on competitive strategy and international competitiveness. The author of 18 books and over 125 articles, Professor Porter's ideas have guided economic policy throughout the world. Professor Porter has led competitiveness initiatives in nations and states such as Canada, India, Kazakhstan, New Zealand, and Connecticut; guides regional projects in Central America and the Middle East; and is Co-Chairman of *The Global Competitiveness Report*. In 1994, Professor Porter founded the Initiative for a Competitive Inner City, a non-profit private-sector initiative formed to catalyze business development in distressed inner cities across the United States. The holder of 10 honorary doctorates, Professor Porter has won numerous awards for his books, articles, public service, and influence on several fields.

Xavier Sala-i-Martin

Xavier Sala-i-Martin is a Professor in the Department of Economics at Columbia University. He was previously Associate Professor at the Department of Economics at Yale University, and a Visiting Professor at Universitat Pompeu Fabra. His research interests include economic growth, macroeconomics, public finance and social security, health and population economics, monetary economics, poverty, inequality, estimation of the world distribution of income, and measuring competitiveness. He is a consultant on growth and competitiveness for a number of countries, international institutions, and corporations. Professor Sala-i-Martin is a Research Associate at the National Bureau of Economic Research. He earned his MA and his PhD in Economics from Harvard University. He collaborates closely with the World Economic Forum in his capacity as Chief Adviser to the Global Competitiveness Network.

Scott Stern

Scott Stern is an Associate Professor of Management and Strategy at the Kellogg School of Management, and a Research Associate of the National Bureau of Economic Research. He received his PhD in Economics from Stanford University, and was an Assistant Professor of Management at the Sloan School at MIT, as well as a Non-Resident Senior Fellow of the Brookings Institution. He is a co-organizer of the Innovation Policy and the Economy Group at the National Bureau of Economic Research and a Senior Fellow of the Searle Center. His research is focused on the drivers and consequences of innovation, and the impact of innovation on entrepreneurship, competitive strategy, and economic growth. In 2005, Dr Stern was awarded the first Ewing Marion Kauffman Prize Medal for Distinguished Research in Entrepreneurship.

The World Economic Forum would like to thank FedEx and USAID for their invaluable support of this *Report*.

FedEx continues to support the World Economic Forum's annual *Global Competitiveness Report*, providing reliable global distribution services.

FedEx is committed to advancing free trade and driving global commerce and economic development. We support the World Economic Forum's dedication to improving the state of the world by engaging leaders in regulatory, industry, and economic cooperation.

Recently, FedEx looked deeper into factors impacting the global economy, commissioning a second study by SRI International titled "The Dynamic Force of Access: An Update of the Access Index." The study provides a qualitative and quantitative assessment of the impact of how people, businesses, and nations "access" ideas, goods, technology, and markets. The information gleaned from this study is complementary to the insights in the Forum's *Global Competitiveness Report*. As FedEx continues to explore Access, we look forward to better understanding how to harness the momentum of the global economy to continue to create positive change around the world.

FedEx Corp. (NYSE: FDX) provides customers and businesses worldwide with a broad portfolio of transportation, e-commerce, and business services. With annual revenues of US\$38 billion, the company offers integrated business applications through operating companies competing collectively and managed collaboratively, under the respected FedEx brand. Consistently ranked among the world's most admired and trusted employers, FedEx inspires its more than 290,000 employees and contractors to remain "absolutely, positively" focused on safety, the highest ethical and professional standards, and the needs of their customers and communities.

USAID is an independent federal government agency that receives overall foreign policy guidance from the Secretary of State.

The USAID mission is to create a more secure, democratic, and prosperous world for the benefit of the American people and the international community.

Our work supports long-term and equitable economic growth and advances US foreign policy objectives by supporting economic growth, agriculture, and trade; global health; and democracy, conflict prevention, and humanitarian assistance.

We provide assistance in four regions of the world: Sub-Saharan Africa, Asia and the Near East, Latin America and the Caribbean, and Europe and Eurasia.

With headquarters in Washington, DC, USAID's strength is its field offices around the world.

We work in close partnership with private voluntary organizations, indigenous organizations, universities, American businesses, international agencies, other governments, and other US government agencies. USAID has working relationships with more than 3,500 American companies and over 300 US-based private voluntary organizations.
